# Trends in Cardiovascular Disease Mortality Among Persons With HIV in New York City, 2001–2012

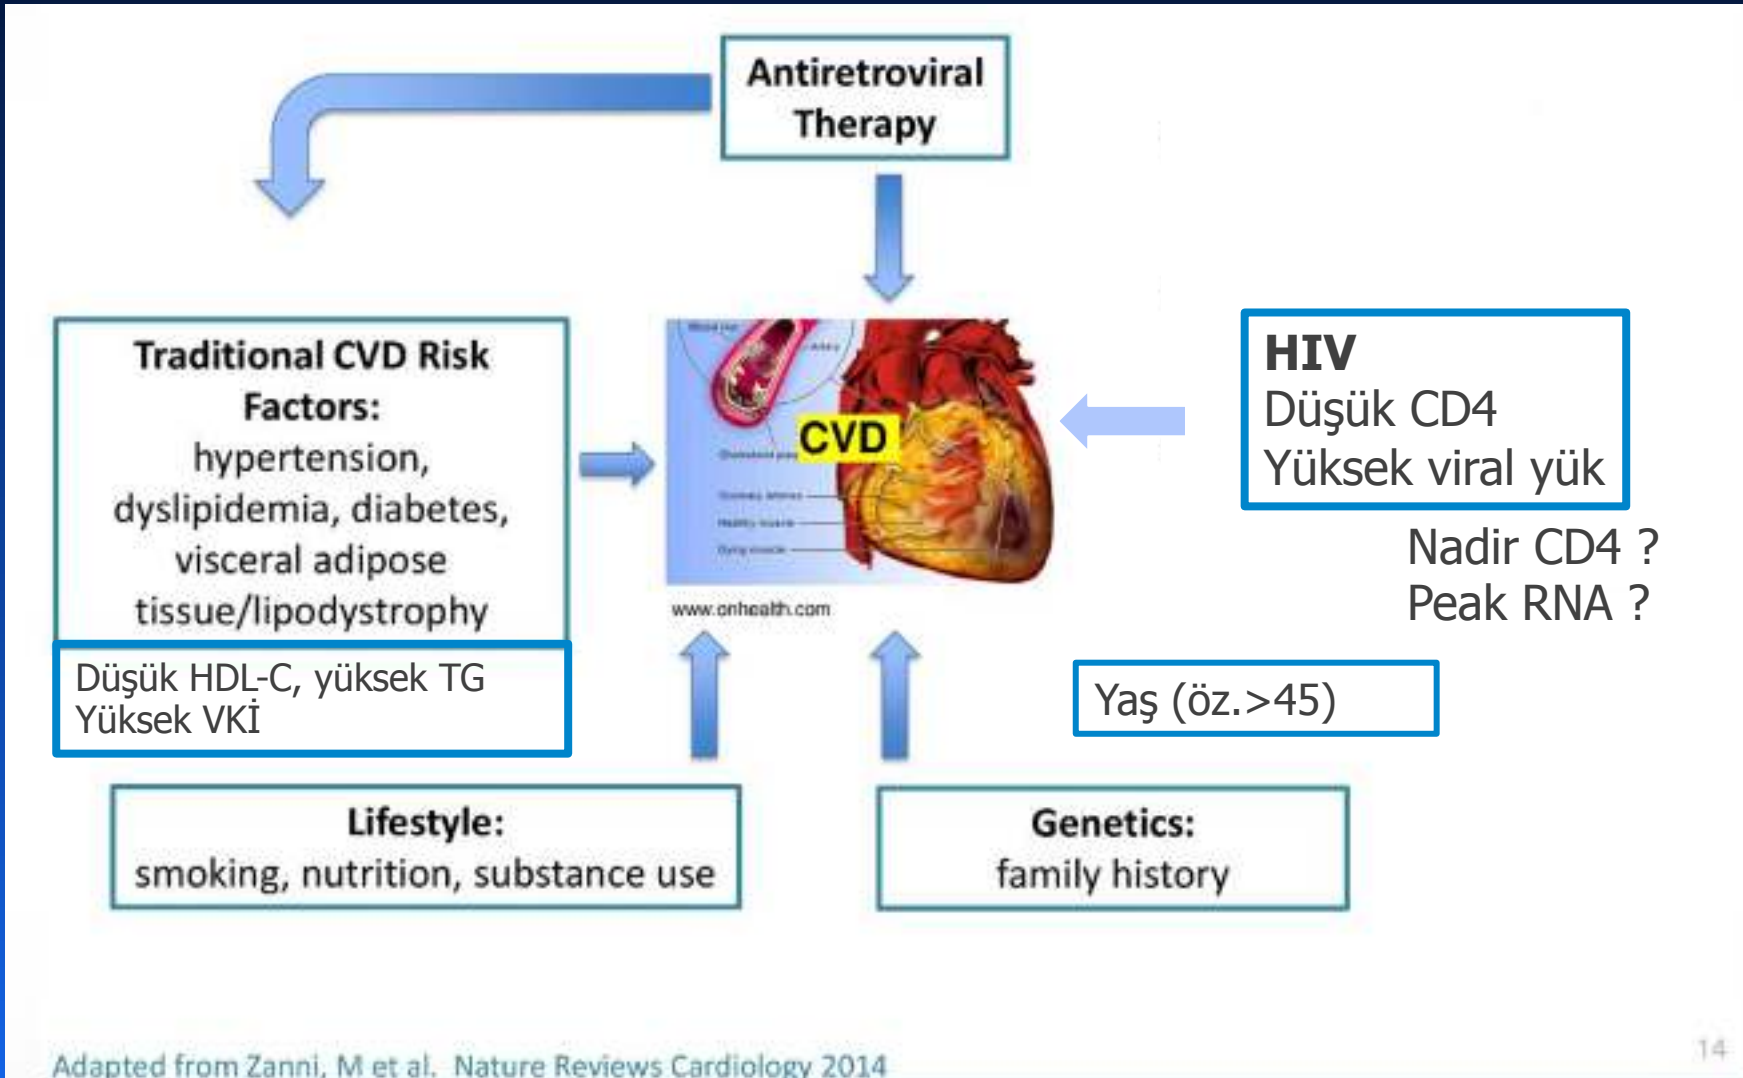

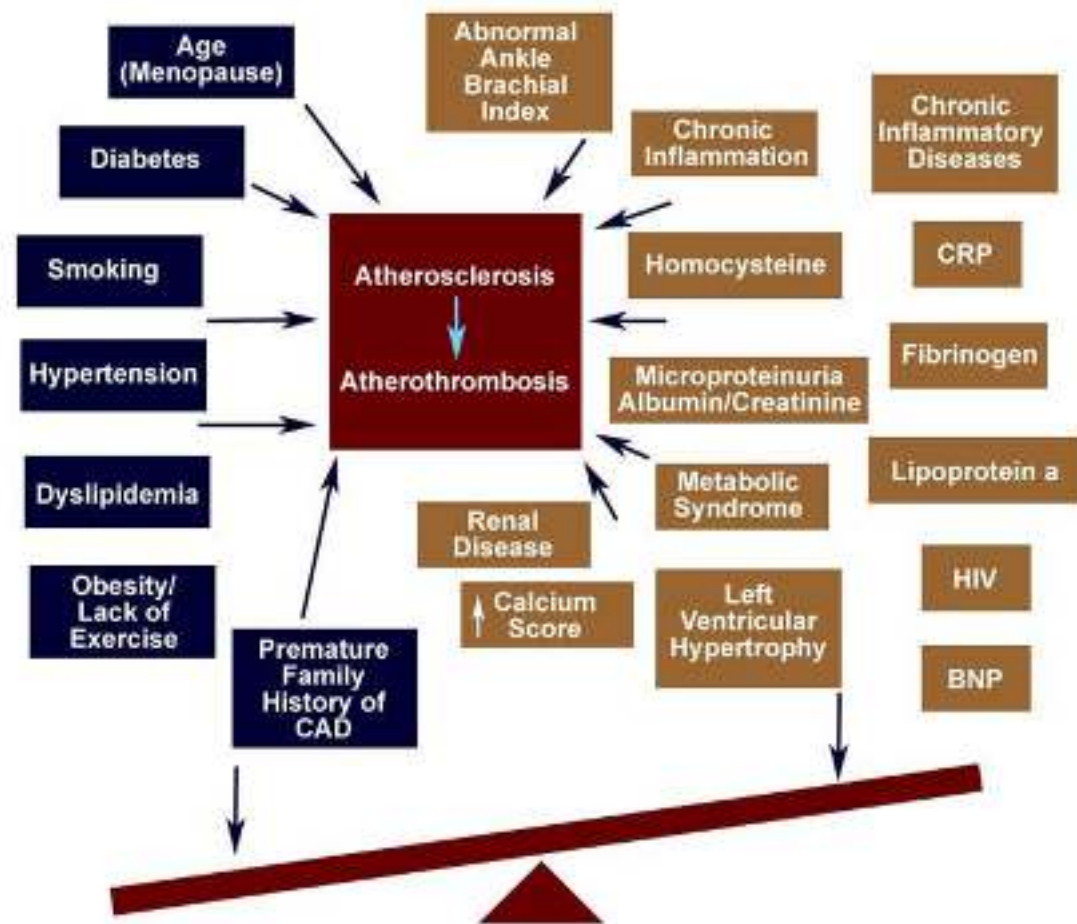

# Risk faktörleri

Traditional Risk Factors

Non-Traditional Risk Factors

Major Risk Factors for Coronary Artery Disease

- Age (men  $\geq 45$  years; women  $\geq 55$  years)
- Family history of premature coronary artery disease (CAD in male first-degree relative  $< 65$  years)
- Hypertension (BP  $> 140/90$  mmHg or on antihypertensive medications)
- Cigarette Smoking
- Diabetes
- Hypercholesterolemia
- Low HDL cholesterol ( $< 40$  mg/dl)
- Hypertriglyceridemia ( $> 200$  mg/dl)
- Obesity

# ART ve KVS

- **ART ile birlikte**
  - ilaç toksisitesi,
  - düşük HDL-C, yüksek TG
  - vücut yağ dağılımında bozukluk,
  - metabolik sorunlar (dislipidemi, DM, ve KVH) artıyor
- **ART kesilmesi ile de KVH riski artıyor**
  - Kardioprotektif etki ortadan kalkıyor, tekrar proinflamatuar sitokinler artıyor, HDL-C azalıyor.

- **Proteaz inhibitörleri**
  - Dislipidemi, hiperkolesterolemi, hipertrigliseridemi
  - Lopinavir-r, indinavir →KVH riski yüksek
  - Atazanavir-r, darunavir-r → risk düşük
  - Atazanavir →kolesterol ve TG düşürücü etki
- **NNRTIs**
  - Tot.kolesterol ve LDL-C artışı
  - Rilpivirine < efavirenz
- **NRTIs**
  - **Abacavir ve didanozin → MI riski yüksek ?**
    - D.A.D. cohort verisi (RR:1.98).
      - ✓ Metabolik send. ve renal hast. → yanıltıcı sonuçlar
    - SMART verisi. MI riski 4X yüksek
  - **TAF → tot.kol, LDL ve HDL-C'de hafif artış → klinik önemi ?**

Table 4 | Effect of antiretroviral therapies on blood lipid levels<sup>190</sup>

Class	Drug	Effect on blood lipids	Refs
Protease inhibitors	Atazanavir	Increases HDL-C and decreases LDL-C levels	191
	Darunavir	Increases HDL-C levels	191
	Fosamprenavir	Hypertriglyceridaemia	192
	Ritonavir <sup>a</sup>	Increases HDL-C levels	191
	Saquinavir	Neutral	192
	Tipranavir	Dyslipidaemia	192
NRTIs	Abacavir	Increases total cholesterol, LDL-C and HDL-C levels	193
	Lamivudine	Increases total cholesterol, LDL-C and HDL-C levels	193
	Tenofovir fumarate disoproxil	Lowers LDL levels	194
	Zidovudine	Hypertriglyceridaemia	194
NNRTIs	Efavirenz	Increases total cholesterol, LDL-C, HDL-C and triglyceride levels	193
	Nevirapine	Neutral or decreases lipid levels	195
	Rilpivirine	Neutral	193
Integrase inhibitors	Dolutegravir	Neutral	133
	Raltegravir	Increases HDL levels	191

HDL-C, HDL cholesterol; LDL-C, LDL cholesterol; NNRTI, non-nucleoside reverse-transcriptase inhibitor; NRTI, nucleoside reverse-transcriptase inhibitor. <sup>a</sup>Although ritonavir is a protease inhibitor, this drug is generally used as a pharmacokinetic enhancer.

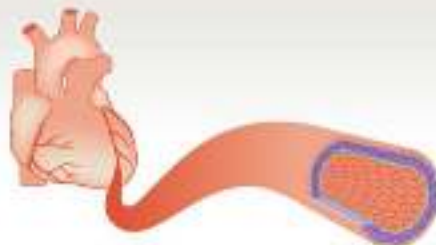

Table 2 | Effect of antiretroviral therapy on the risk of cardiovascular disease

Study (year)	Study population	ART	Number of patients	Follow-up	Cardiovascular end points	Findings	Refs
Bazzette et al. (2003)	Patients with HIV infection who received care at a VA centre	Combination therapy with PIs, nucleoside analogues and NNRTIs	36,766	8.5 years	CVD and cerebrovascular disease	Use of ART was associated with a reduction in the risk of CVD	<sup>186</sup>
D:A:D study group (2003)	Patients with HIV infection	Combination regimen including a PI or an NNRTI	73,468	7.2 years	MI	Use of ART was associated with a 26% relative increase in rate of MI per year of exposure	<sup>181</sup>
SMART (2008)	Patients with well-controlled HIV infection; cohort from 33 countries	Continuous ART versus episodic use of ART	5,472	16 months	Opportunistic disease or death from any cause; major cardiovascular, renal or hepatic disease	Continuous ART reduced the risk of CVD compared with episodic use of ART	<sup>182</sup>
D:A:D study group (2007)	Patients with HIV infection	PIs or NNRTIs	23,437	5.2 years	MI	Exposure to PIs was associated with a higher rate of MI per year of exposure	<sup>183</sup>
D:A:D study group (2008)	Patients with HIV infection	NRTIs	33,347	7.2 years	MI	Use of abacavir or didanosine in the previous 6 months was associated with increased risk of MI	<sup>184</sup>
Stein et al. (2015)	Patients with HIV infection without known CVD or diabetes mellitus who were initiating their first ART	NRTI, PI or integrase inhibitor	328	6.4 years	Changes in carotid artery IMT	Atazanavir had a protective effect, with slower carotid IMT progression in the setting of high plasma bilirubin levels compared with other ART regimens	<sup>185</sup>
START (2015)	Patients with HIV infection; cohort from 35 countries	Immediate initiation of ART versus deferred initiation of ART	4,299	6.4 years	MI, stroke, coronary revascularization or CVD-related death	Early initiation of ART did not significantly reduce the incidence of the cardiovascular end point	<sup>186</sup>
Marconi et al. (2018)	Individuals with or without HIV infection and without known CVD	NRTI, PI or NNRTI	96,381	8.8 years	CVD including acute MI, heart failure and stroke	Decreased risk of CVD in the setting of high plasma bilirubin levels irrespective of HIV infection status	<sup>120</sup>
Eliou et al. (2018)	Patients with HIV infection	NRTI	8,265	12 years	Type 1 and type 2 MI	Use of abacavir in the past 6 months was associated with increased risk of MI	<sup>187</sup>
D:A:D study group (2018)	Patients with HIV	PIs	49,709	>15 years	CVD	Use of ritonavir-boosted darunavir but not ritonavir-boosted atazanavir was associated with increased risk of CVD	<sup>188</sup>

ART, antiretroviral therapy; CVD, cardiovascular disease; IMT, intima-media thickness; MI, myocardial infarction; NNRTI, non-nucleoside reverse-transcriptase inhibitor; NRTI, nucleoside reverse-transcriptase inhibitor; PI, protease inhibitor; VA, Veterans Affairs.

# İlk deęerlendirmede...

## Risk faktörlerinin araştırılması:

- **Sigara alışkanlığı**
- **Diyet**
- **Egzersiz**
- **Ailede KAH, HT, DM**
- **FM.de KB, bel çevresi, VKİ**
- **Lab: Açlık lipid seviyeleri, AKŞ, HbA1c**

# Framingham hesaplaması

1. Age:  yr

2. Gender:  Male  Female

3. Smoker?  Yes  No

4. Diabetes?  Yes  No

5. BP lowering treatment?  Yes  No

6. Systolic blood pressure:  mmHg

7. Total cholesterol:  mmol/L

8. HDL:  mmol/L

# Risk hesaplama

Risk Score	Population	Target Cardiovascular Events	Variables Included
FRS- CHD (Framingham)	30 – 74 years	Angina, MI, CHD death, coronary insufficiency	Age, Total Cholesterol, HDL-C, BP, Diabetes status, Smoking, Gender
ATP3-FRS-CHD (ATP3)	>20 years	MI, CHD death	Age, Total Cholesterol, HDL-C, BP, Smoking, Gender, <u>Antihypertension</u> Medication use
DAD (DAD)	HIV, European	MI	Age, Total Cholesterol, HDL-C, BP, Diabetes status, Smoking, Gender, <u>Abacavir</u> use, Duration of <u>indinavir</u> use, Duration of <u>lopinavir</u> use
2013 ACC/AHA ASCVD Pooled Cohort Equations (ASCVD)	40 – 79 years	MI, CHD death, stroke	Age, Total Cholesterol, HDL-C, BP, Diabetes status, Smoking, Gender, White or African American Ethnicity, <u>Antihypertension</u> Medication use

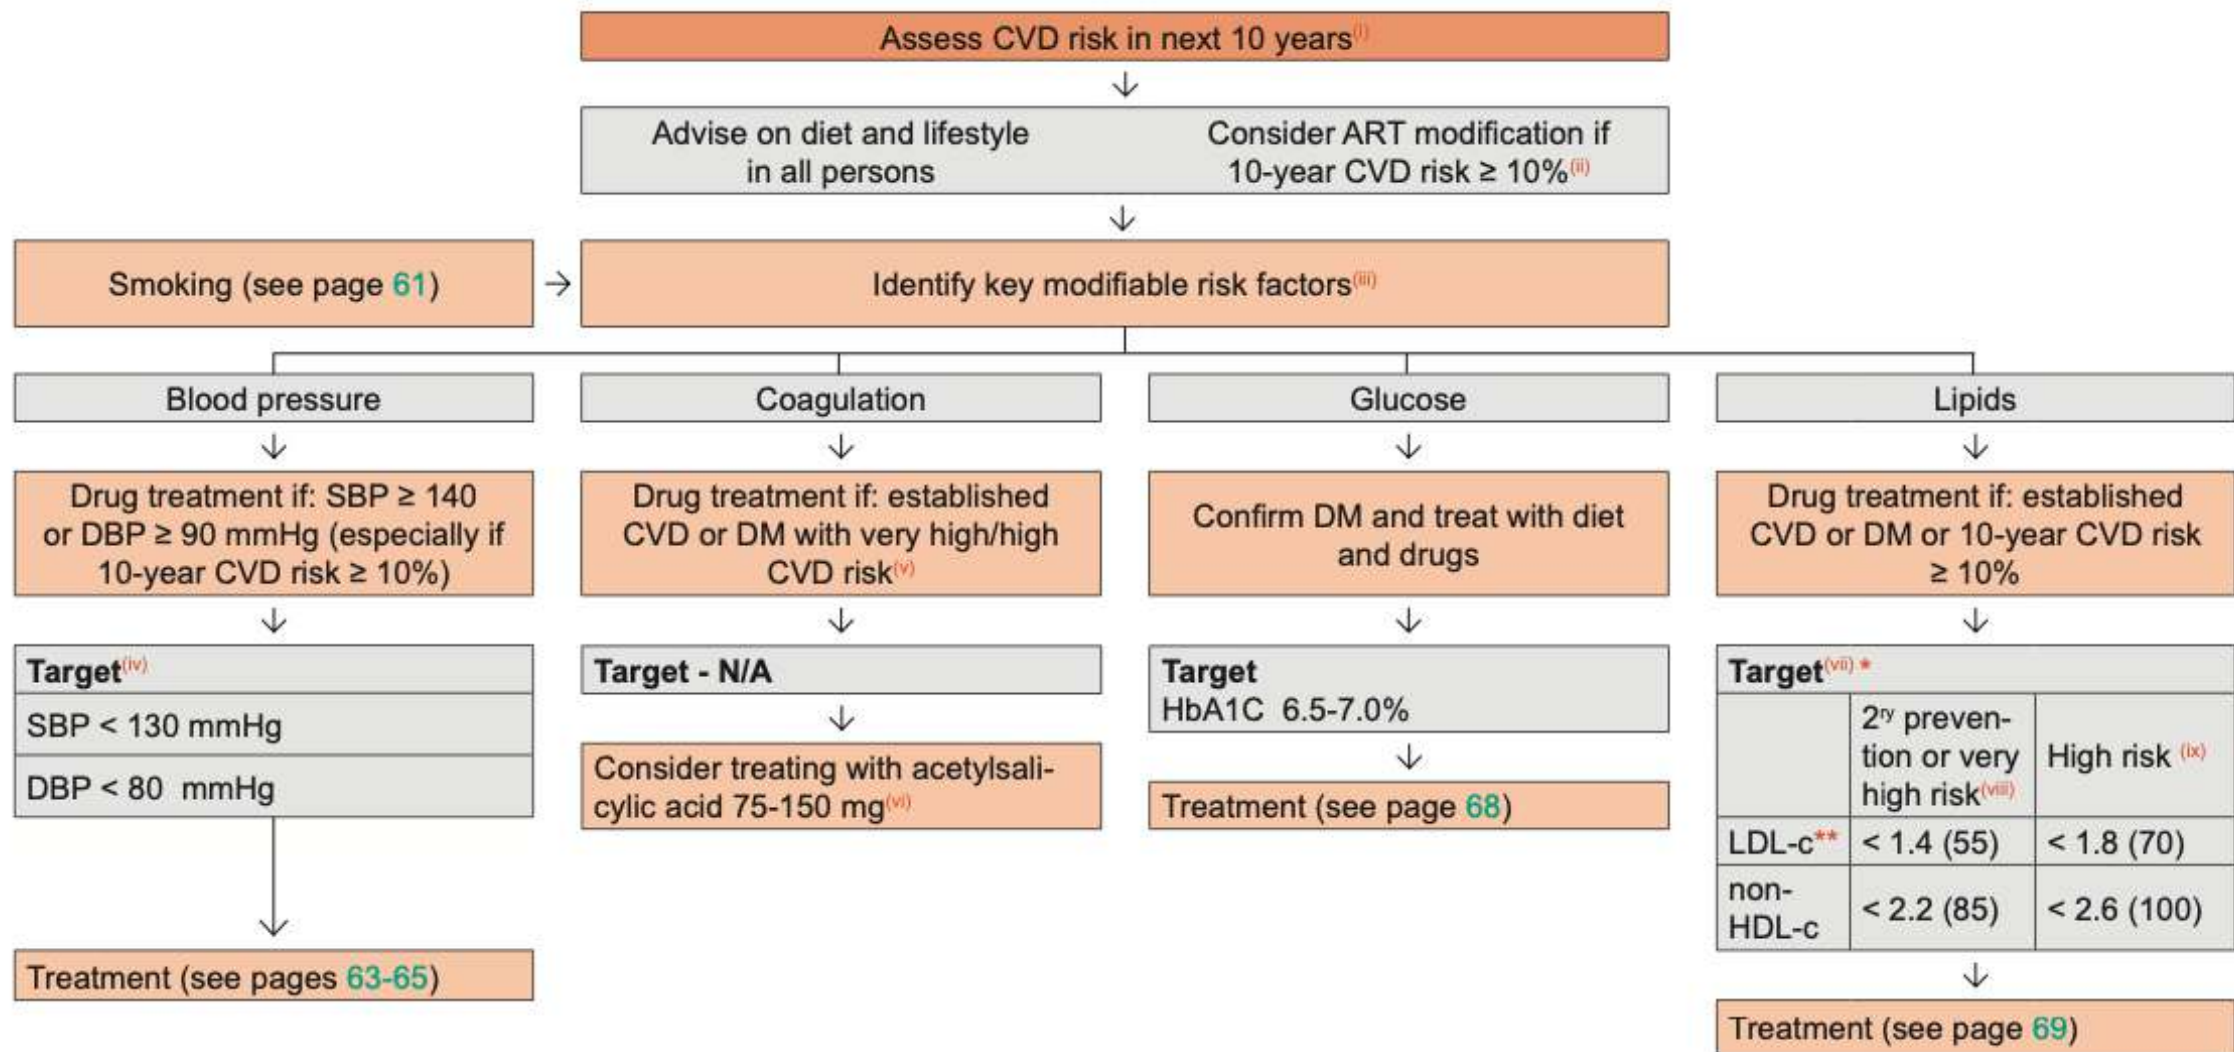

# İlave faktörler

- HCV koenfeksiyonu
- Metabolik sendrom
- Lipodistrofi veya yağlı KC
- HIV tedavi başarısızlığı veya uyumsuzluğu
- Düşük CD4 sayısı (<350 /mm<sup>3</sup>)
- Uzamış HIV viremisi ve geç ART başlanmış olması

# Riski azaltmak

- Yaşam stilinin deęişmesi (sigara, alkol, diyet, fiziksel aktivite,...)
- Gereęinde statin tedavisi
- KB kontrolü
- DM tedavisi

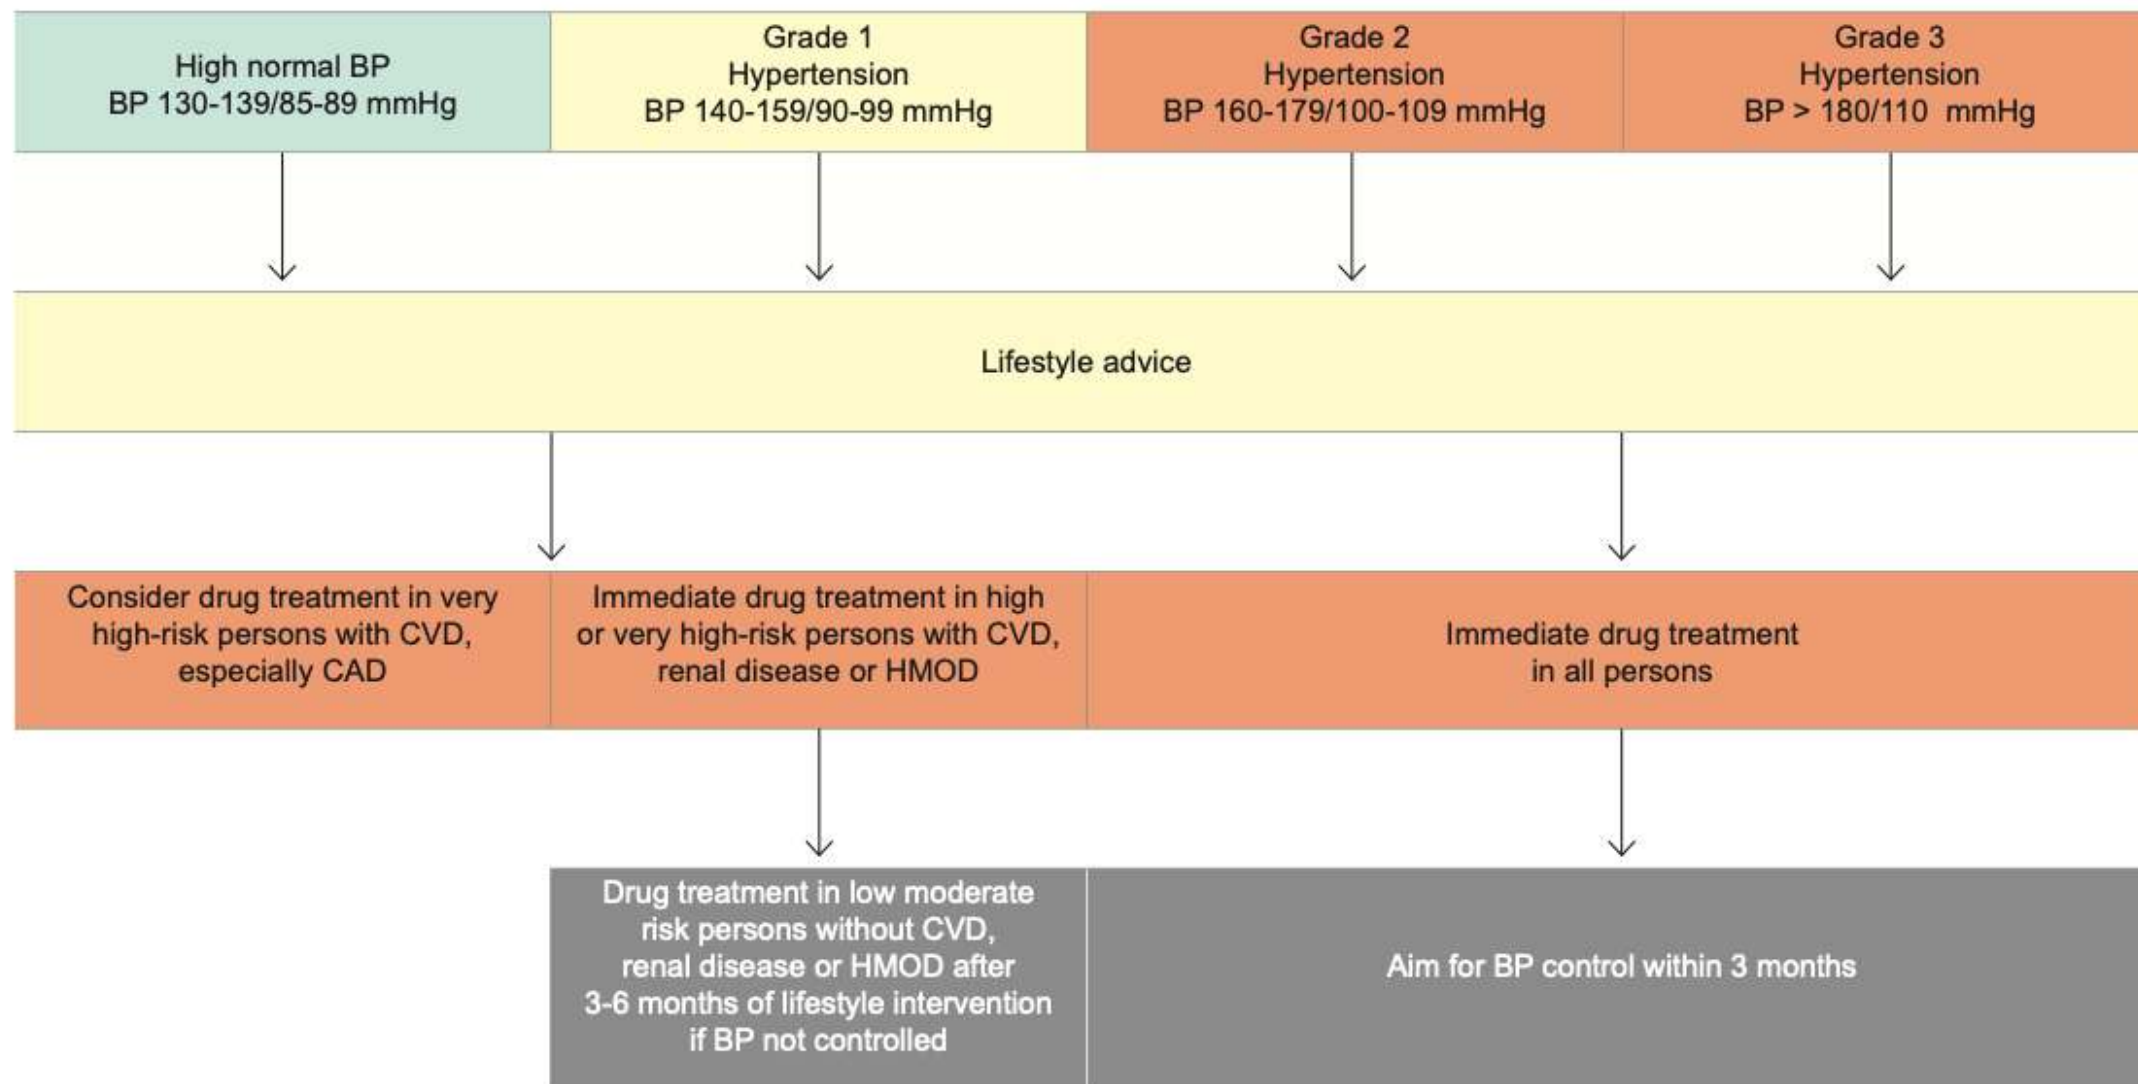

\* Fasting or non-fasting samples may be used

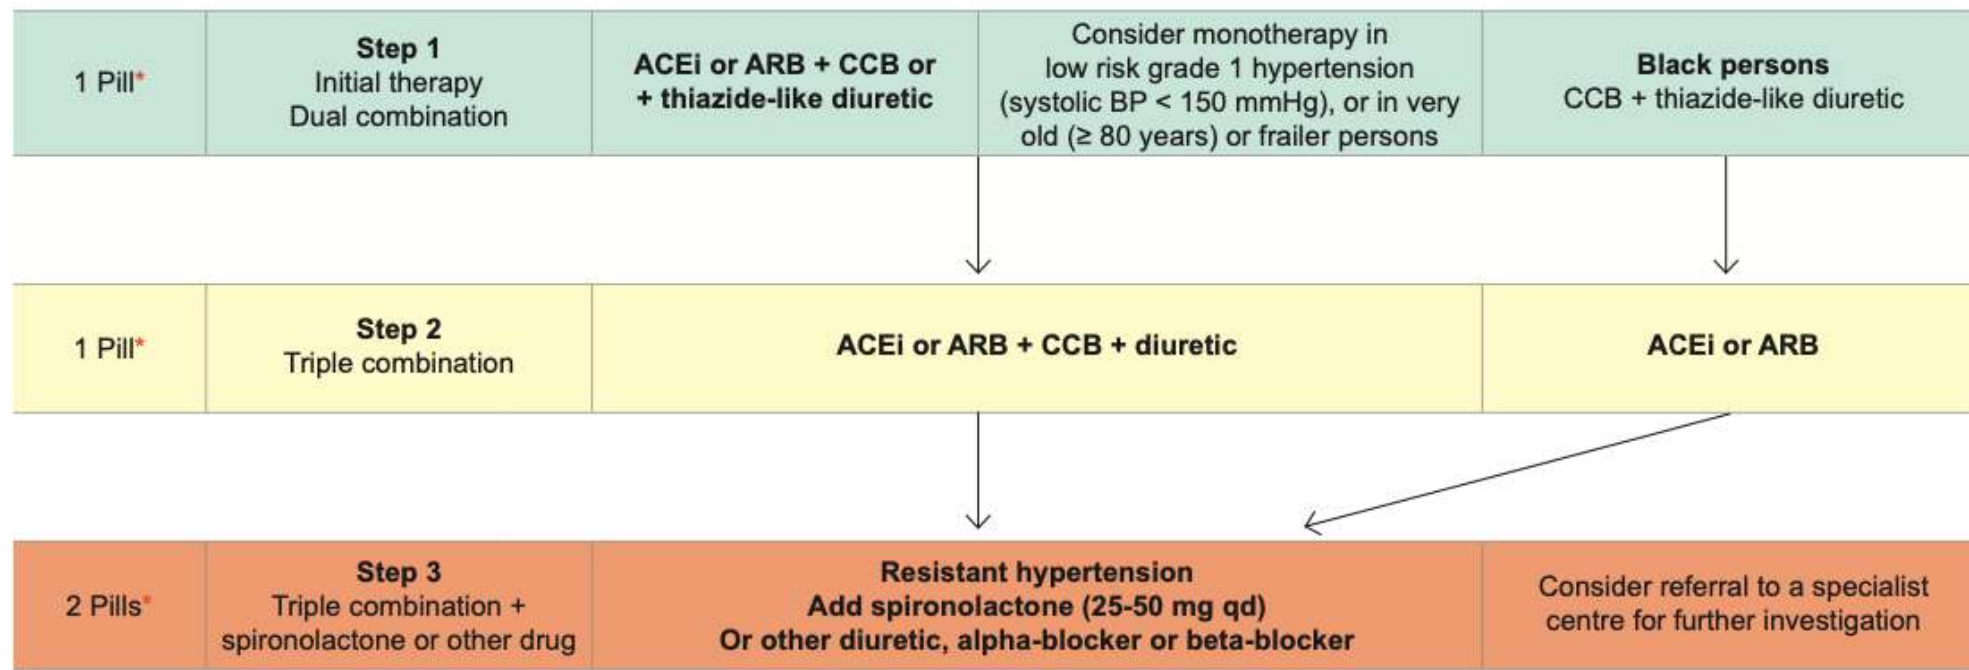

\*\* and ≥ 50% reduction from baseline

# Hypertension: Diagnosis, Grading and Management

## Hypertension: Drug Sequencing Management

**Beta-blockers**  
Consider beta-blockers at any treatment step, when there is a specific indication for their use, e.g. heart failure, angina, post-MI, atrial fibrillation, or younger women with, or planning, pregnancy

Living with HIV (treated, virally suppressed)

- Age  $\geq 21$  with **Clinical ASCVD** (prior MI, angina, stroke, or CVD equivalent such as peripheral arterial disease)?
- Age  $\geq 21$  **LDL-c  $\geq 190$  mg/dL** (untreated)? And/or
- Age 40-75 with **Diabetes**?

Benefits/risks of lipid-lowering therapy uncertain

NO

Age 40-75 years old?

YES

**Assess ASCVD Risk**

using ACC/AHA ASCVD Risk Estimator or alternative (such as D:A:D or Framingham CVD Risk Estimation Model)

NO

YES

### **HIGH RISK APPROACH**

Consider referral to cardiologist; patient-clinician discussion re: benefit vs. risk, patient preference

### **LIFESTYLE OPTIMIZATION**

(Particularly Smoking Cessation)

+

### **LIPID LOWERING DRUG THERAPY**

Atorvastatin 10-80 mg\*

Rosuvastatin 5-40 mg\*

Pitavastatin 2-4 mg

### **Statin Dosing: START LOW, GO SLOW**

Decrease dose or discontinue if severe myalgia or unexplained muscle weakness, LFTs  $>3x$  the upper limit of normal, or CK  $>10x$  the upper limit of normal

## Assess ASCVD Risk

using ACC/AHA ASCVD Risk Estimator or alternative (such as D:A:D or Framingham CVD Risk Estimation Model)

### HIV-Related CVD Risk-Enhancing Factors?

Any of the following:

- History of prolonged HIV viremia and/or delay in ART initiation
  - Low current or nadir CD4 count (<350 cells/mm<sup>3</sup>)
  - HIV treatment failure or non-adherence
- Metabolic syndrome, lipodystrophy/lipoatrophy, fatty liver disease
  - Hepatitis C Virus Co-Infection

NO

YES

**Risk may not be greater than calculated ASCVD risk**

*Contemporary studies suggest that people with promptly treated HIV without sustained viremia or immunosuppression may not have significantly elevated ASCVD risk*

**Risk may be greater than calculated ASCVD risk**

*Consider adjusting risk upward. Studies generally demonstrate 1.5-2-fold greater risk for ASCVD in persons with HIV, particularly if there is a history of prolonged viremia, delayed ART initiation, and/or low CD4 count*

## High Risk for ASCVD?

Determination of high risk may be based on any of the following:

10-year ASCVD risk  $\geq 7.5\%$  (including potential upward adjustment of estimate if HIV-related CVD risk-enhancing factors are present)

If using alternative models, high-intermediate or greater risk?

D:A:D: 5-year CVD risk  $\geq 3.5\%$

Framingham: 10-year CVD risk  $\geq 10\%$

and/or

Selected general ASCVD Risk Enhancers  
(adapted from 2018 ACC/AHA Guidelines):

- Family history of early MI/stroke (men  $< 55$ , women  $< 65$ )
- Persistently elevated LDL-C  $\geq 160$  mg/dL ( $\geq 4.1$  mmol/L)
- Chronic kidney disease, pre-eclampsia, premature menopause
- Subclinical atherosclerosis (Arterial plaque; CAC  $> 0$ ; ABI  $< 0.9$ )
- In selected individuals (if measured): Lp(a)  $> 50$  mg/dL ( $> 125$  nmol/L); hs-CRP  $\geq 2.0$  mg/L; apoB  $\geq 130$  mg/dL

YES

NO

*inhibitor on an individualized basis.*

## LOW-MODERATE RISK APPROACH

**LIFESTYLE OPTIMIZATION**  
*(Particularly Smoking Cessation)*

+

**YEARLY RE-ASSESSMENT OF RISK**  
*Consider high risk approach if patient-clinician discussion determines potential benefit  $>$  risk and patient preference for high risk approach*

### **HIGH RISK APPROACH**

*Consider referral to cardiologist; patient-clinician discussion re: benefit vs. risk, patient preference*

### **LIFESTYLE OPTIMIZATION**

*(Particularly Smoking Cessation)*

+

### **LIPID LOWERING DRUG THERAPY**

*Atorvastatin 10-80 mg\**

*Rosuvastatin 5-40 mg\**

*Pitavastatin 2-4 mg*

#### **Statin Dosing: START LOW, GO SLOW**

*Decrease dose or discontinue if severe myalgia or unexplained muscle weakness, LFTs >3x the upper limit of normal, or CK >10x the upper limit of normal*

*\*Exercise caution due to drug interactions at high end of dose range; consider if very high risk and/or known CAD. If familial hypercholesterolemia, severe statin intolerance, or insufficient response to statin as determined by clinician: consider ezetimibe +/- PCSK9 inhibitor on an individualized basis.*

# Lipid düşürücü tedavi

- KVH, Tip-2 DM, Yüksek KVH riski varsa

→statinler

**kullanılmalı !!!**

- Statin tedavisi KVH riskini %20-30 azaltır.
- İlaç etkileşimlerine dikkat!!!
- Ciddi TG yüksekliği (>500 mg/dL) varsa
  - Gemfibrozil (600 mg tid)
  - Fenofibrate (54- 160 mg/gün)

### Drugs used to lower LDL-c

Drug class	Drug	Dose	Adverse effects	Advice on use of lipid lowering therapy together with ART	
				use with PI/r	use with NNRTIs
Statin <sup>(i,viii)</sup>	Atorvastatin <sup>(ii)</sup>	10-80 mg qd	Gastrointestinal symptoms, headache, insomnia, rhabdomyolysis (rare) and toxic hepatitis	Start with low dose <sup>(v)</sup> (max daily dose: 10 mg (ATV/r); 20 mg (LPV/r); 40 mg (DRV/r))	Consider higher dose <sup>(vi)</sup>
	Fluvastatin <sup>(iii)</sup>	20-80 mg qd		Consider higher dose <sup>(vi)</sup>	Consider higher dose <sup>(vi)</sup>
	Pravastatin <sup>(iii)</sup>	20-80 mg qd		Consider higher dose <sup>(vi,vii)</sup>	Consider higher dose <sup>(vi)</sup>
	Rosuvastatin <sup>(ii)</sup>	5-40 mg qd		Start with low dose <sup>(v)</sup> (max daily dose: 10 mg (ATV/r, LPV/r) 20 mg (DRV/r))	Start with low dose <sup>(v)</sup>
	Simvastatin <sup>(ii)</sup>	10-40 mg qd		Contraindicated	
	Pitavastatin <sup>(viii)</sup>	1-4 mg qd		No interaction expected	
Intestinal cholesterol absorption inhibitor <sup>(i,ix)</sup>	Ezetimibe <sup>(iv)</sup>	10 mg qd	Gastrointestinal symptoms	No interaction expected	
PCSK9-inhibitors <sup>(x)</sup>	Evolocumab	140 mg 2 weekly or 420 mg monthly	Nil	No interaction expected	
	Alirocumab	75 mg or 150 mg 2 weekly			

- **Düşük dozda statin başlanıp toksisiteden kaçarak LDL-kol düşüşünü arttırmaya çalışılır.**
- **CPK ve KCFT izlenir**

# ART seçimi

- Naif hastada ilk seçenekler uygun
- Deneyimli, ART altında ve lipid profili bozuk hastada rejimi değiştirmenin kısıtlı faydası olabilir...??
- Dislipidemik, viral supresyon sağlanmış hastada lopinavir/r veya diğer PIs > INSTIs
- PIs >NNRTI (rilpivirin, darunavir)

# Coronary Artery Calcification and Plaque Characteristics in People Living With HIV: A Systematic Review and Meta-Analysis

MD; Amjad Samara, MD; Matthew F. Yuyun MD, PhD; Justin B. Echouffo-Tcheugui MD, PhD; Ahmad Masri MD, MS; Ahmad Samara, MD; Alan R. Morrison MD, PhD; Nina Lin MD, MPH; Sebahat Erqou MD, PhD

### A Calcified plaque

### B Non-calcified plaque

**Kalsifiye plak prevalansı 31% vs 41%**

**Nonkalsifiye plak prevalansı 49% vs 20%**

**Plak varlığı için OR: 1.09 (95% CI, 1.00–1.17).**

**Kalsifiye plak varlığı için OR: 0.79 (95% CI, 0.65–0.92);**

**Non-kalsifiye plak için OR: 1.23 (95% CI, 1.08–1.38) (subklinik AS !!!)**

# Sonuç olarak

- **Kronik inflamasyon devam ettiği sürece KVH riski devam edecektir**
- **Erken ART, yaşam tarzında iyileştirme, düzenli kontolde kalmak ve risk değerlendirmesi ile riski azaltmak mümkün olacaktır.**

The Cure for all  
**HIV & AIDS**

---

Dr. Hulda Regehr Clarke
