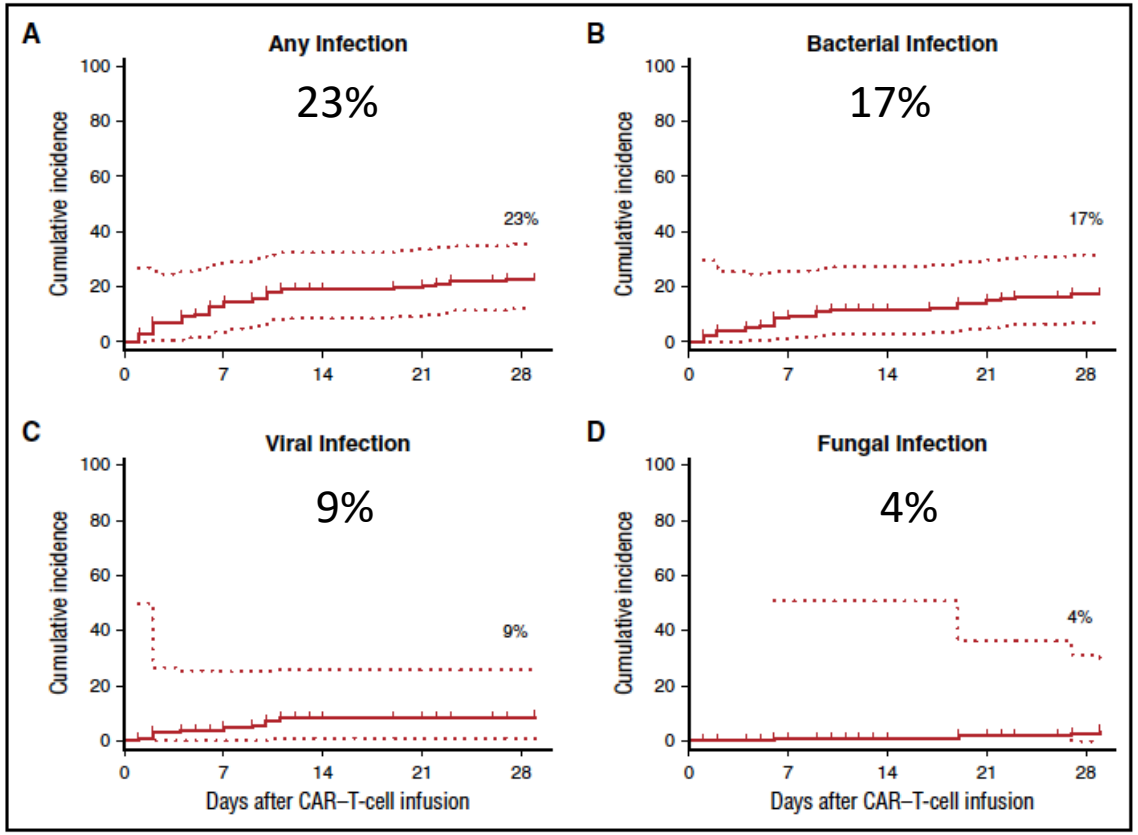
IMMUNOBIOLOGY AND IMMUNOTHERAPY

Infectious complications of CD19-targeted chimeric antigen receptor–modified T-cell immunotherapy

Joshua A. Hill,[1,2] Daniel Li,[3] Kevin A. Hay,[4,5] Margaret L. Green,[1,2] Sindhu Cherian,[6] Xueyan Chen,[6] Stanley R. Riddell,[1,4] David G. Maloney,[1,4] Michael Boeckh,[1,2] and Cameron J. Turtle[1,4]



133 patients with R/R B-cell malignancies
- 35% ALL
- 18% CLL
- 47% NHL

3-month follow up

80% infections <10 days

Hill et al. Blood 2018

- Overall prevalence varies:
  - 18-56% prospective trials
  - 20-60% retrospective cohorts
- Factors of variation:
  - Patient related factors
  - CAR T-cell related factors
  - Follow up

Table 1. Pooled data of infectious complications from CAR-T cell therapy.

Reference	CAR T-cell therapy	*N*	Underlying malignancy	Severity grade	Timepoint	Bacterial infection incidence (*n*, %)	Viral infection incidence (*n*, %)	Fungal infection incidence (*n*, %)
Abramson *et al.*[34]	Lisocabtagene maraleucel	269	R/R B-cell lymphoma	⩾3	12 months	27/269 (10)	4/269 (1)	2/269 (1)
Locke *et al.*[38]	Axicabtagene ciloleucel	108	Refractory B-cell lymphoma	All	12 months	44/108 (40)	11/108 (10)	7/108 (6)

Clinical Infectious Diseases

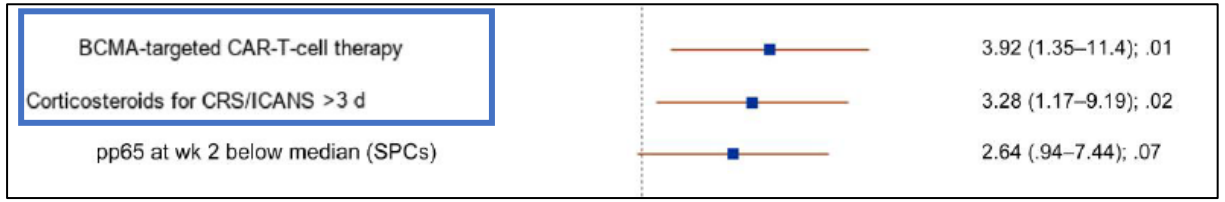
MAJOR ARTICLE

72 CMV positive CD19, CD20, BCMA recipents

CMV testing before and weekly up to 12 weeks post CAR T-cell therapy

Overall incidence of CMV reactivation:
27% (CI 16.8-38.2%)

RISK FACTORS



Kampouri et al. CID 2024; 78: 1022-1032.

- CMV replication was relatively frequent in patients with R/R aggressive B cell lymphoma receiving CAR T cell therapy, but viral load is usually low, self-limited, and not associated with end-organ damage.

- Median onset: 3 weeks after CAR T-cell therapy

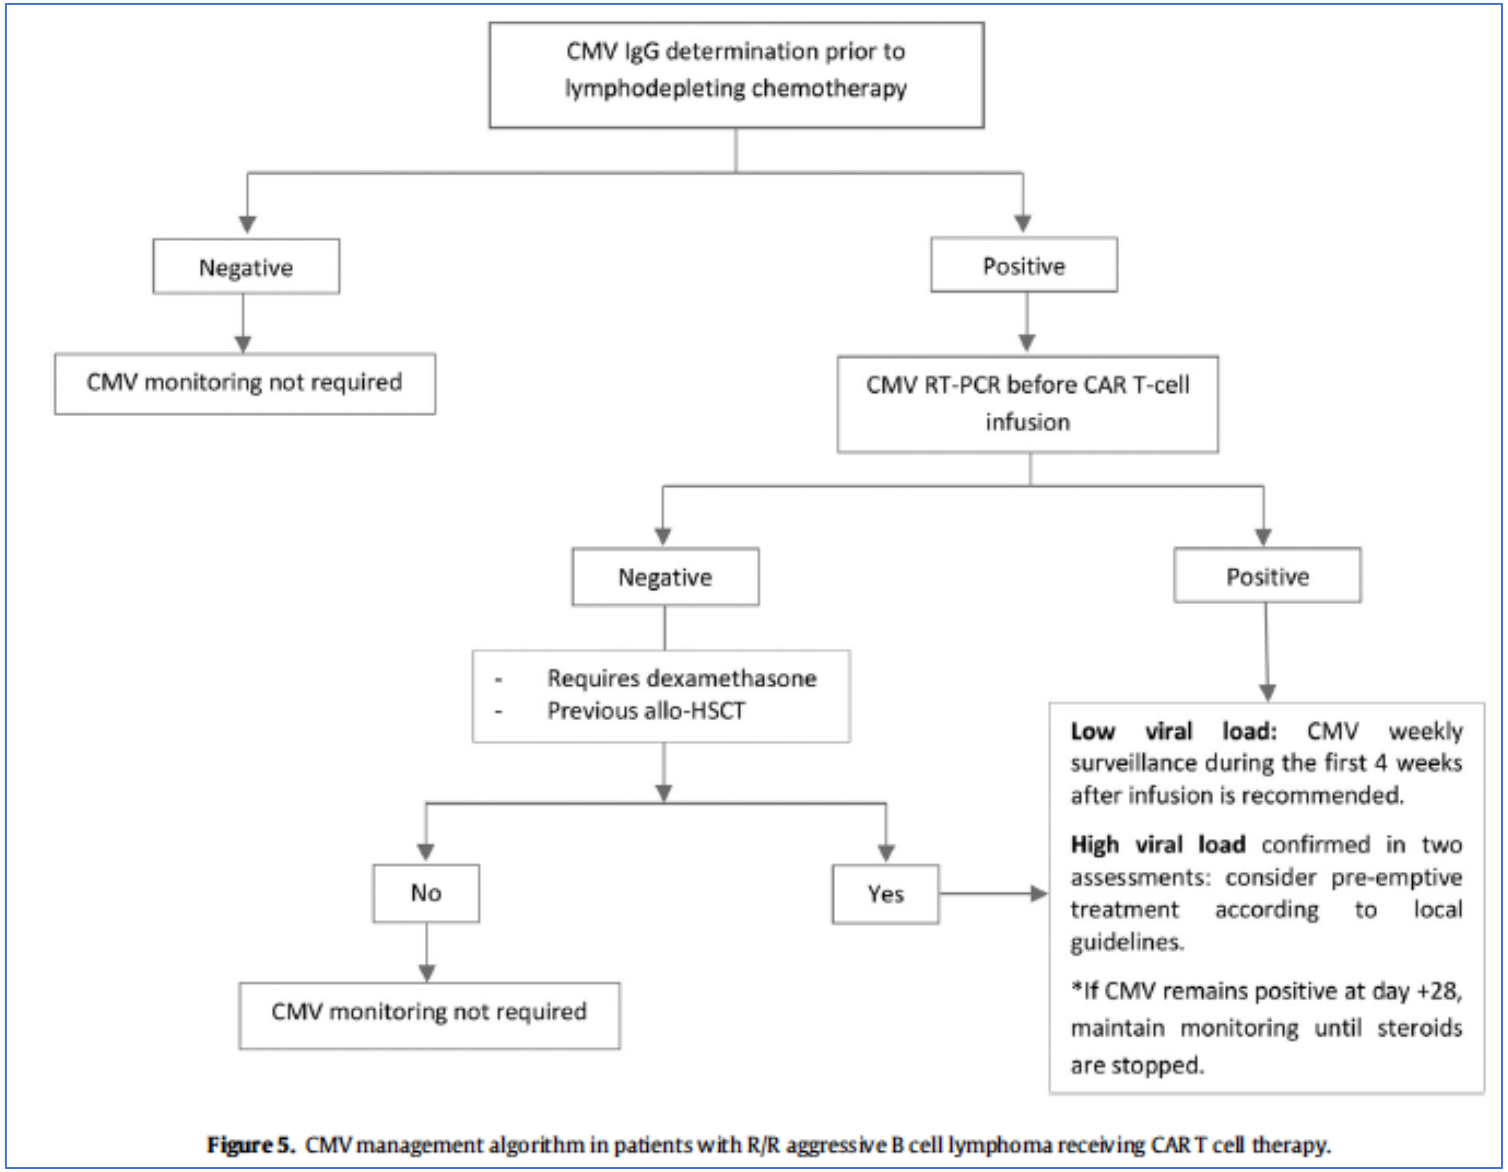


Figure 5. CMV management algorithm in patients with R/R aggressive B cell lymphoma receiving CAR T cell therapy.

Marquez-Algaba et al. Transplant Cell Ther 2022

Low incidence of fungal infections : 1-5%

- Mainly candidemia
  - Risk factors
    - Prolonged course of steroids
    - **Duration of neutropenia**
- Mold infections are rare
  - Aspergillus sp.
  - Pneumocystis jiroveci

Systematic review

Predicting infections in patients with haematological malignancies treated with chimeric antigen receptor T-cell therapies: A systematic scoping review and narrative synthesis

Gemma Reynolds [1, 2, 3, 4, *], Beatrice Sim [1, 3], Mary Ann Anderson [5], Tim Spelman [3], Benjamin W. Teh [1, 2, 3], Monica A. Slavin [1, 2, 3], Karin A. Thursky [1, 2, 3]

Summary of key pre-treatment post-treatment variables significant associated with all-cause infection in CAR-T-treated patients

	Significant predictors in ≥3 studies	Significant predictors in ≥1 studies
Before CAR-T treatment	Number of lines of prior therapy	Disease bulk Bridging therapy CAR-T dose Prior infections Baseline neutropenia ALL (underlying disease) Adult (vs. paediatric patients) 30-d CAR-T non-response
After CAR-T treatment	Multivariate analyses: Steroid use Treatment-emergent neutropenia Univariate analyses: Cytokine release syndrome Neurotoxicity Tocilizumab (steroid use)	

ALL, acute lymphoblastic leukaemia; CAR-T, Chimeric antigen receptor T.

Reynolds CMI 2023; 29: 1280-8.

Infectious complications after CAR T-cell terapy: Risk factors

Host-related factors

- Underlying disease
  - Type
  - Status
- Previous therapies (cumulative immunosuppression)
- Previous chemotherapy and biological therapy
- Previous HSCT
  - Allogeneic
  - Autologous
- Baseline cytopenia
- Comorbidities
- History of previous infections
- Antimicrobial prophylaxis

Treatment-related factors

- Type of CAR T-cell therapy
  - Dose and administration schedule
  - Resulting cytopenias and other haematological side effects
- Conditioning regimen
- Resulting hypogammaglobulinaemia
- Severe adverse events requiring additional immunosuppression
  - Cytokine release syndrome
  - Neurotoxicity
  - Haemophagocytic lymphohistiocytosis and macrophage activation syndrome

➡ Cumulative immunosuppressive state

Gudiol et al. Lancet Haematol 2021; 8:e216-228.

CRS and ICANS as risk factors for infection

Post-CAR–T-cell infusion variables	Unadjusted HR* (95% CI)	P
CAR–T-cell dose level, cells per kg		
2×10^7 vs 2×10^5	3.19 (1.07-9.51)	.038
2×10^7 vs 2×10^6	3.15 (1.24-8.01)	.016
ANC < 500 cells per mm^3 on day of infection	2.04 (0.85-4.89)	.11
CRS grade		
0 vs 1-3 vs 4-5†	3.38 (1.99-5.73)	<.001
Neurotoxicity grade		
0 vs 1-2 vs 3-5‡	1.76 (1.11-2.78)	.015
Tocilizumab use§	3.45 (1.23-9.67)	.019
Corticosteroid use§	1.50 (0.43-5.23)	.5
ICU admission	4.35 (1.78-10.65)	.001

How I prevent infections in patients receiving CD19-targeted chimeric antigen receptor T cells for B-cell malignancies

Joshua A. Hill[1-4] and Susan K. Seo[5,6]

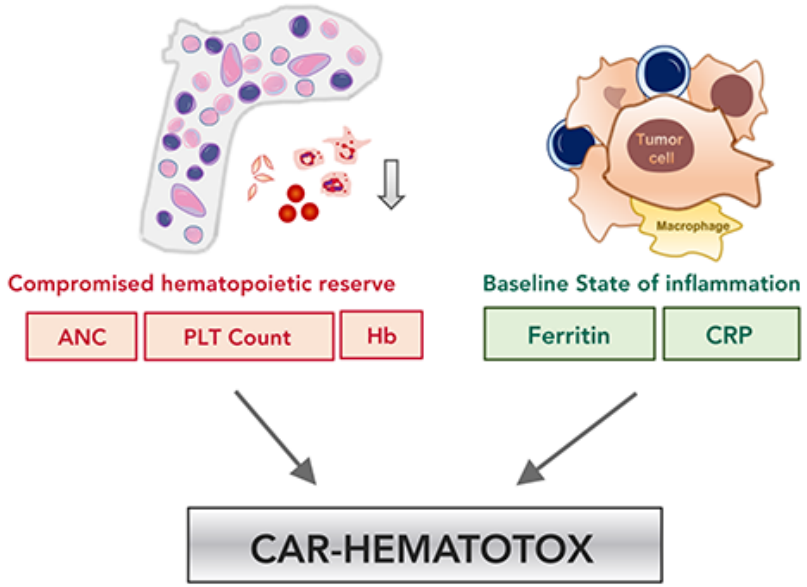
High-risk patients are those who meet any of the below criteria

- Receiving >1 dose of tocilizumab
- Requiring >3 days of ≥10 mg dexamethasone per day within a 7-day period
- Receiving 1 or more doses of methylprednisolone ≥1 g per day
- Receiving second-line agents for management of CRS or ICANS (eg, anakinra, siltuximab)

Hill et al. Blood 2018

Hill et al. Blood 2020

CAR-HEMATOTOX score



Low risk : 0 - 1 **High risk ≥ 2**

Features	0 Point	1 Point	2 Points
Platelet count	> 175.000/µl	75.000 - 175.000/µl	< 75.000/µl
Absolute neutrophil count (ANC)	> 1200/µl	≤ 1200/µl	-
Hemoglobin	> 9.0 g/dl	≤ 9.0 g/dl	-
C-reactive protein (CRP)	< 3.0 mg/dl	≥ 3.0 mg/dl	-
Ferritin	< 650 ng/ml	650-2000 ng/ml	> 2000 ng/ml
Low: 0-1 High: ≥2

Prior to lymphodepleting chemotherapy (day-5)
Determine individual risk factors of hematox and infection

Low risk (HT 0-1)

	LBCL (n = 235)	MCL (n = 103)	MM (n = 113)
Median duration of severe neutropenia (ANC<500/µL, D0-60)	5.5 days (95% CI 5-8 days)	6 days (95% CI 5-7 days)	3 days (95% CI 2-5 days)
Aplastic phenotype	2.6%	0%	3%
Severe infection rate	8%	5%	5%
Severe bacterial infection rate	0.9%	5%	3%

High risk (HT 2-7)

	LBCL (n = 235)	MCL (n = 103)	MM (n = 113)
Duration of severe neutropenia (ANC<500/µL, day 0-60)	12 days (95% CI 10-16 days)	14 days (95% CI 9-18 days)	9 days (95% CI 7-13 days)
Aplastic phenotype	36%	47%	32%
Severe infection rate	40%	30%	40%
Severe bacterial infection rate	27%	28%	34%

Rejeski et al. Blood 2023; 10: 865-877.

Impact of cytopenias during CAR T-cell therapy

- Baseline cytopenias are common prior to CAR T-cell therapy
  - Neutropenia occurs in ~30-35% of patients
  - Severe lymphopenia in 80% of patients
  - Low CD4T after 1 year post CAR T-cell infusion
  - Baseline hypogammaglobulinemia in up to 40%

- Cytopenias post CAR T-cell can persist months or years
  - Grade ¾ in 30% of patients
  - Hypogammaglobulinemia in up to 70% of patients, can persist for years

Park CID 2018, Hill Blood 2018, Logue Hematologica 2020.

Yakoub-Agha[35]

Table 12. Infection prophylaxis post-CAR-T

	EBMT/EHA recommendation	Comments
Neutropenia	G-CSF to shorten duration of neutropenia from day +14 or after resolution of CRS or ICANS Can consider starting earlier, e.g. day 5,[a] if patient is at high risk of infection, e.g. ALL, post-allo-HCT, high-dose steroids. For persistent neutropenia ($<0.5 \times 10^9$/l) following day +28, consider G-CSF	Avoid if patient has CRS or ICANS
Antibacterial prophylaxis	Not routinely recommended[b]	Can be considered in case of prolonged neutropenia and should be based on local guidelines, e.g. with levofloxacin or ciprofloxacin
Anti-viral	Valaciclovir 500 mg bid or aciclovir 800 mg bid	Start from LD conditioning until 1-year post-CAR T-cell infusion AND until $CD4^+$ count $>0.2 \times 10^9$/l
Anti-pneumocystis	Co-trimoxazole 480 mg once daily or 960 mg three times each week To start from LD conditioning until 1-year post-CAR-T cell infusion AND until $CD4^+$count $>0.2 \times 10^9$/l Where there is prolonged myelosuppression, postpone start after ANC $>0.5 \times 10^9$/l	Can be started later depending on centre guidelines In case of co-trimoxazole allergy (or cytopenias precluding use of co-trimoxazole), pentamidine inhalation (300 mg once every month), dapsone 100 mg daily or atovaquone 1500 mg once daily can be considered
Systemic anti-fungal prophylaxis	Not recommended routinely; consider posaconazole (300 mg/day) or fluconazole (200 mg/day) or micafungin (50 mg i.v./day) in patients with severe (ANC $<0.5 \times 10^9$/l) or prolonged (>14 days) neutropenia and/or in patients on long-term or high-dose (>72 h) corticosteroids or in patients post-allo-HCT	In patients with prior allo-HCT, prior invasive aspergillosis and those receiving corticosteroids, posaconazole prophylaxis should be considered
i.v. Immunoglobulin	Routine in children. Consider in adults with serious/ recurrent infections with encapsulated organisms and hypogammaglobulinemia (<4 g/l)	Clinical evidence does not support routine use in adults following allo-HCT

Table 13. Eligibility criteria for vaccination in patients receiving CD19-targeted CAR T-cell therapy

Agent	EBMT/EHA recommendations		Comments
	Pre-CAR-T	Post-CAR-T	
Influenza vaccine	Preferably vaccinate 2 weeks before LD In B-cell aplasia low likelihood of serological response	>3 months after CAR-T patients should be vaccinated irrespective of immunological reconstitution	Where there is incomplete immune reconstitution[a] or ongoing immunosuppression, there is a high likelihood of lower vaccine responses. Consensus view is that vaccination may still be beneficial to reduce rates of infection and improve clinical course. Consider boost upon B-cell recovery
SARS-CoV-19	Preferably vaccinate before CAR-T therapy In B-cell aplasia low likelihood of serological response	>3 months after CAR T-cell infusion	Limited data is available on vaccine response after CAR-T, and early reports suggest impaired serological responses.[84] However, SARS-CoV-19 vaccine-induced protection relies heavily on T-cell-mediated immunity, therefore B-cell aplasia does not seem to be a contraindication; no T-cell threshold has been defined. Post-vaccination response monitoring is desirable. Guidance on re-vaccination post-CAR-T and frequency/dosing of booster vaccines will vary between countries. National guidelines should be followed in this area of rapidly evolving clinical practice
Killed/inactivated vaccines		>6 months after CAR-T and >2 months after immunoglobulin replacement	Contraindications include concurrent immunosuppressive or cytotoxic therapy
Live and non-live adjuvant vaccines		1 year after CAR-T and fully immune reconstituted[a]	Contraindications include <2 years post-allo-HCT, <8 months after completion of immunoglobulin replacement

Hayden et al. Annals Oncol 2022

Vaccine schedule recommendations and updates for patients with hematologic malignancy post-hematopoietic cell transplant or CAR T-cell therapy

Gemma Reynolds[1,2,3] | Victoria G. Hall[1,2] | Benjamin W. Teh[1,2]

TABLE 4 Vaccination schedule[a] for adult patients treated with chimeric antigen receptor T-cell (CAR-T) therapy.[99]

Vaccines	Pre-CAR-T	≥6 months	≥8 months	≥10 months	≥12 months	≥18 months
IIV	Influenza	Influenza				
PCV		PCV13	PCV13	PCV13		
PPSV23						PPSV23
DTaP		DTaP	Td	Td		
HAV		HAV			HAV	
HBV		HBV	HBV		HBV	
Varicella zoster[b]					aRZV	aRZV

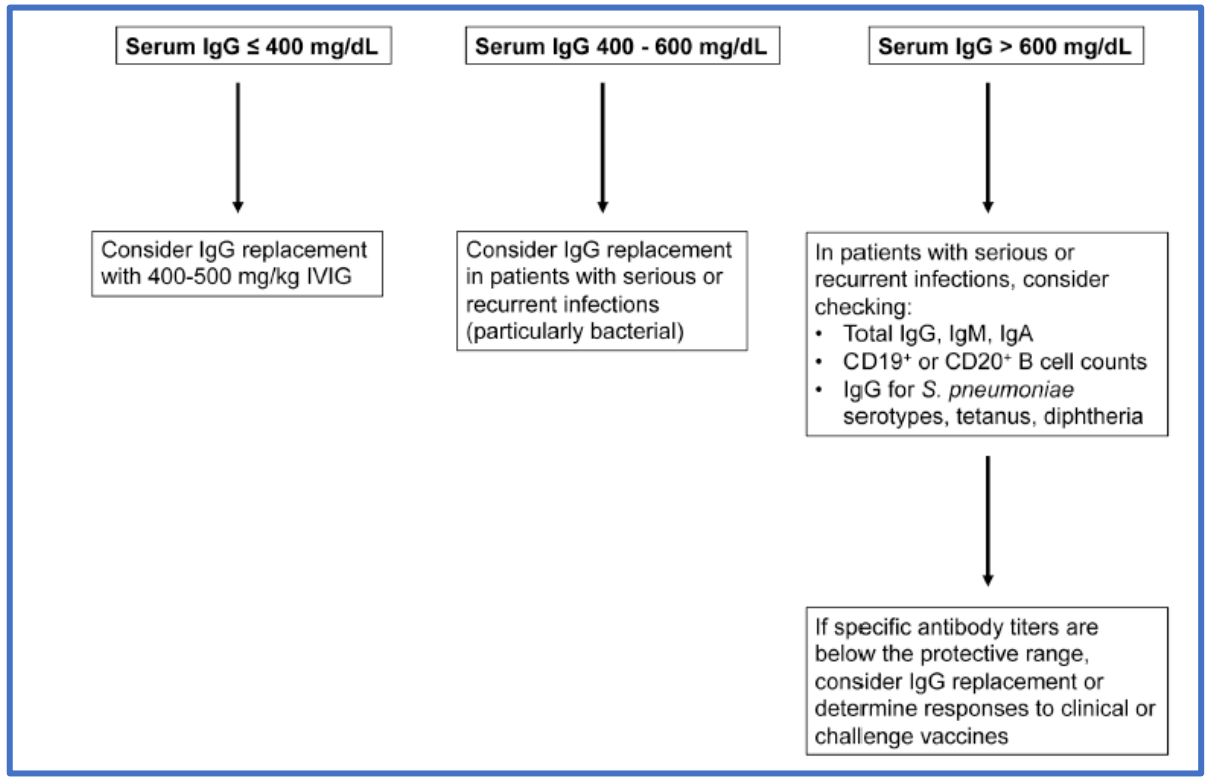
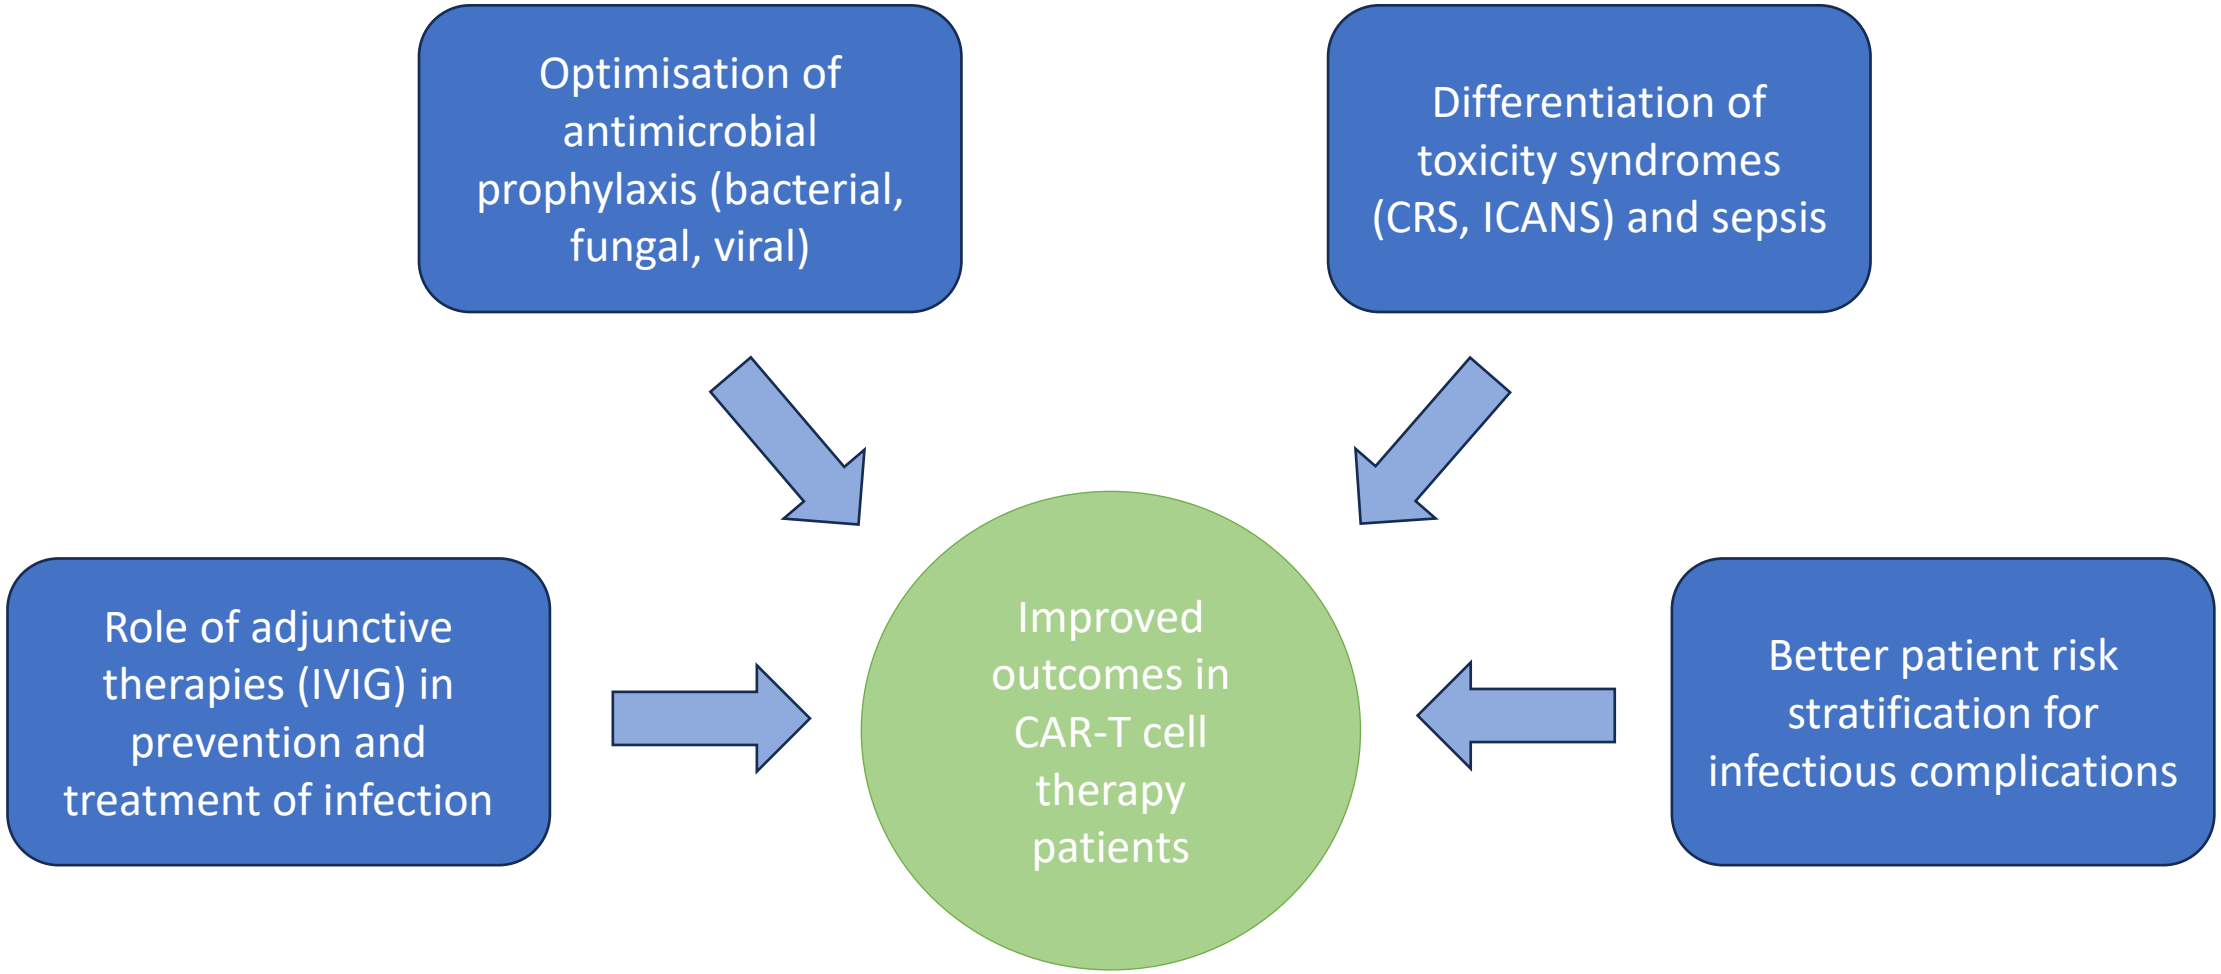
CAR-T– and a side order of IgG, to go? – Immunoglobulin Replacement in Patients Receiving CAR-T Cell Therapy

Joshua A. Hill[1,2], Sergio Giralt[3], Troy R. Torgerson[4,5], Hillard M. Lazarus[6]



Hill et al. Blood Rev 2019; 38:100596.

Research priorities



Take home messages

- Infections are common after CAR T-cell therapy:
  - Bacterial infections predominate in the early phase
  - Viral infections, mainly respiratory, occur late fater CAR T-cell infusion
  - The incidence of fungal infections remains low
- Infectious risk factors are multifactorial: CAR T-cell complications related treatment, prior lines of therapy, underlying disease
- Cytopenias and hypogammaglobulinemia are frequent and can last for months or years
- The CAR-HEMATOTOX score may help identifying patients at high risk of infections
- Preventive strategies are crucial but further studies are warranted to optimize antimicrobial prophylaxis and vaccination.
