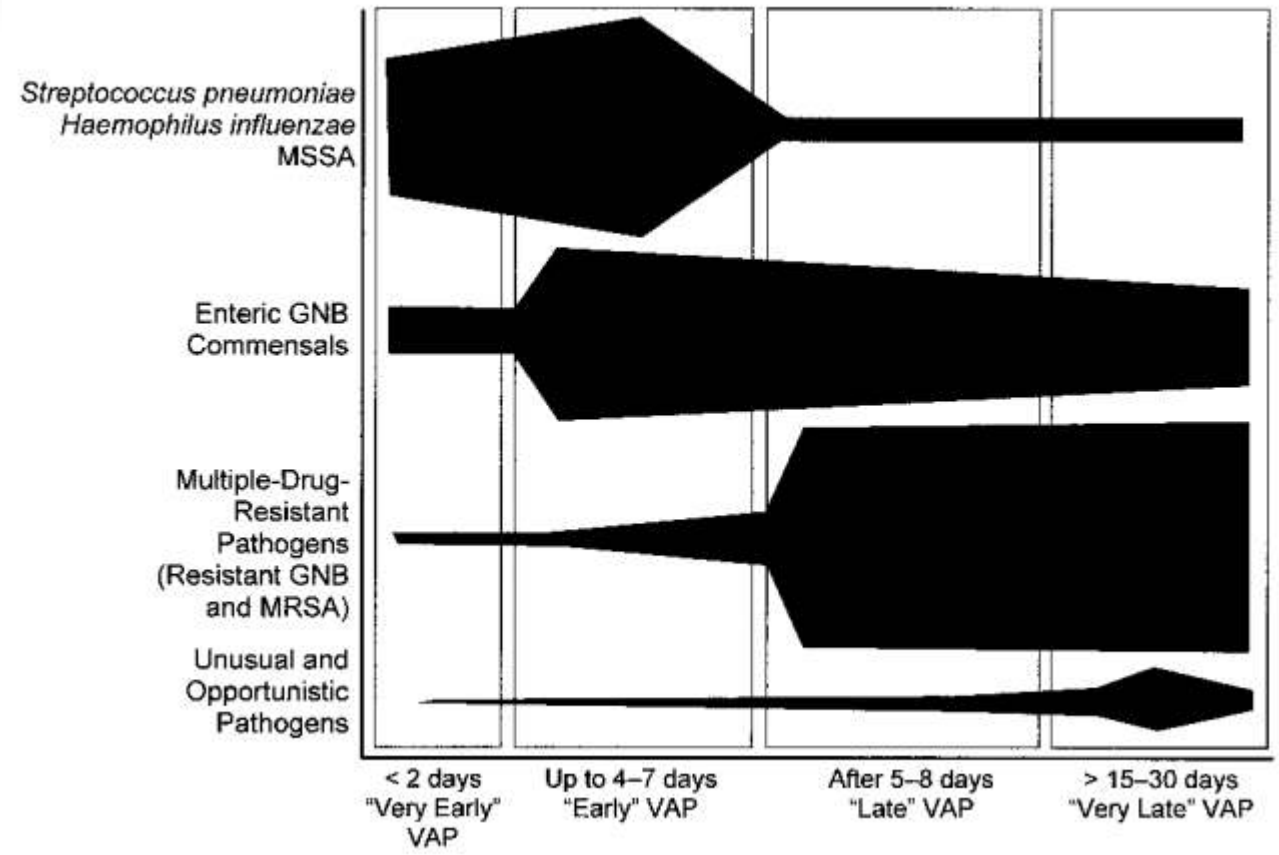
Tanınız Nedir?

Ventilatör ilişkili pnömoni

- Invaziv mekanik ventilasyon desteğindeki hastada, entübasyondan 48-72 saat sonra gelişen pnömoni
- Yeni veya ilerleyici infiltrasyon
- Sistemik enfesiyon bulguları (ateş, beyaz kürede artış)
- Balgam pürülansında artış
- Etken izolasyonu

OLGU
Etken Nedir?



Park DR. The microbiology of ventilator-associated pneumonia. Respir Care 2005;50:742-65

Dirençli Mikroorganizma Ne Zaman Düşünülmeli?

- Antibiyotik kullanımı: 90 gün içinde
- Hastanede yatış öyküsü: (>5 gün)
- Toplumda ve hastanede antibiyotik direncinin yüksek olması
- Sağlık hizmeti ilişkili enfeksiyon
  - Hastanede yatış : 90 gün içinde > 2gün
  - Bakımevinde yaşamak
  - Evde antibiyotik infüzyonu
  - Kronik diyaliz: 30 gün içinde
  - Evde yara bakımı
  - Evde beraber yaşayan kişilerde ilaca dirençli patojen taşıyıcılığı
- İmmünosüpressif hastalık veya tedavi

TABLE 2 - *Antibiotic treatment of 59 hospitalized patients who were infected with influenza A (H1N1)*

	Group I (n=27)	Gruop II (n=25)	Group III (n=7)
First course of antibiotic			
• Ceftriaxone + macrolides or fluorquinolones; *n (%)*	18 (66)	18 (72)	7 (100)
• Piperacillin/tazobactam + macrolides; *n (%)*	5 (19)	4 (16)	0
• Fluorquinolones alone; *n (%)*	4 (15)	3 (12)	0
Days; mean (*range*)	10.4 (1-20)[1]	7.88 (1-14)[2]	5.6 (1-13)[3]
Second course of antibiotic			
• Vancomycin + carbapenems; *n (%)*	NA	12 (48)	3 (43)
• Vancomycin + pip/taz or BEC; *n (%)*	NA	10 (40)	3 (43)
• Carbapenems alone; *n (%)*	NA	3 (12)	1 (14)
Days; mean (range)	NA	10.8 (2-25)[2]	11.5 (1-17)[3]
Third course of antibiotic			
• Tigecycline alone; *n (%)*	NA	NA	2 (28.5)
• Tigecycline + colistin; *n (%)*	NA	NA	3 (43)
• Tigecycline + aminoglycosides; *n (%)*	NA	NA	2 (28.5)
Days; mean (range)	NA	NA	9.3 (5-20)[3]

Group I: patients without VAP who received only one course of antibiotics; Group II: patients with VAP who received 2 courses of antibiotics; and Group III : patients with VAP who received 3 courses of antibiotics.
BEC=broad-spectrum cephalosporins
1 vs 2v3 p 0.0000

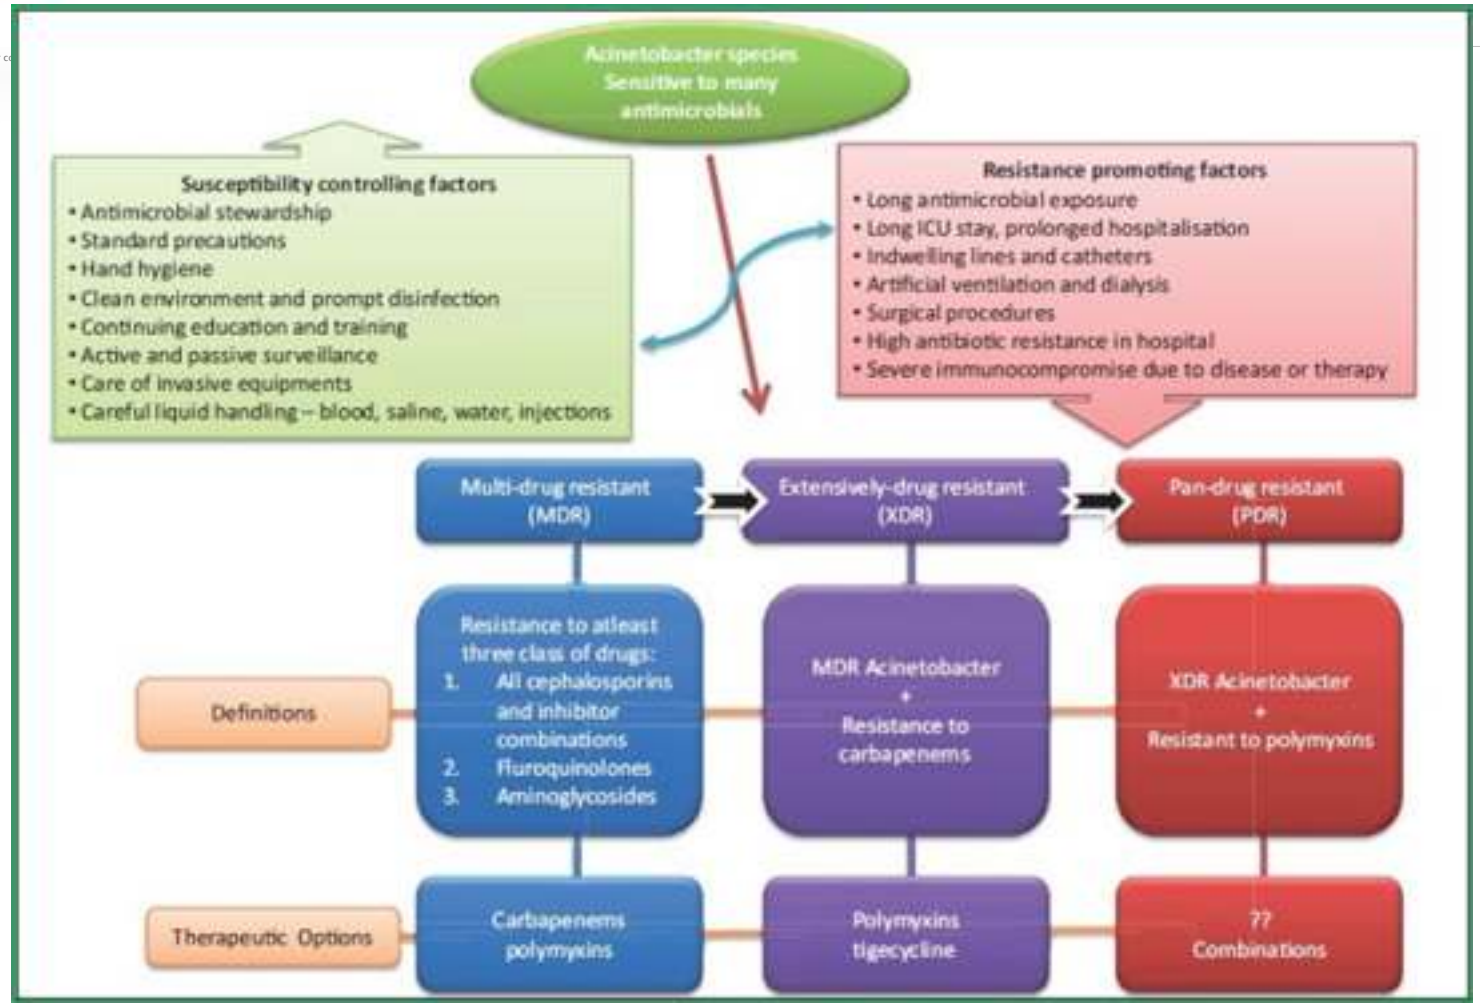
Tedavi Seçenekleri



J Global Infectious Dis 2010;2:291-304

Kolistin

- Polimiksin E

- Bakterisidal

Doz

İntravenöz: 2.5-5 mg/kg (31.250-62.500 IU/kg) / gün 2-4 eşit doz (1 mg=12 500 IU) (2-3X80-160-240 mg)

Aerosolize: 80 mg (1 million IU) every 12 h

İntraventricular: 1.6 mg-20 mg /day

Kolistin

	Colomycin injection	Coly-Mycin M Parenteral
Manufacturer	Dumex-Alpharma A/S,	Parkedale Pharmaceuticals, Rochester,
Main distributors		nc, Bristol, als (Australia/ , NSW, fizer
Labelled content		
Mass of colistime sodium dry powc		
Appearance		hilised cake
Recommended d		in base equivalent er day
	80–160 mg colistimethate sodium three times per day	
Product-recommended upper limit dose for a 60 kg patient*	480 mg of colistimethate sodium per day	800 mg of colistimethate sodium per day

*For patients with normal renal function.

1 MU kolimisin=80 mg CMS=33.3 mg kolistin baz aktivitesi

Kolistin

Farmakokinetik

- Kolistimethanosulfonate (KMS)-kolistine hidrolize olur
- **Atılım:** KMS böbrekten atılır, ancak kolistin renal tübüler absorbsiyon ile alınır ve böbrek dışı yollarla atılır
- Yoğun bakım hastalarında klirens ↓ ve yarı ömrü uzun
- Yüksek doz ve uzun aralıklarla uygulama

Farmakodinamik

- Konsantrasyona bağlı etki
- Kalıcı etki

Kolistin

- Akciğer ve BOS'a geçişi zayıf
- Klinik başarı %25-77
- Yan etkiler

Acta Medica Mediterranea, 2014, 30: 1137

SUMMARY

Acinetobacter baumannii is the most common species to have developed resistance to antibiotics. Due to increasing levels of drug resistance, the available therapeutic options are insufficient in *A. baumannii* infections. This study investigated the efficacy of doripenem monotherapy versus doripenem combination therapy with sulbactam, amikacin, colistin and tigecycline in experimental sepsis. A carbapenem-resistant *A. baumannii* was used to develop a sepsis model in 8-10-week-old Balb/c mice by intraperitoneal injection. Antibiotic therapies were initiated two hours after injection of bacterial suspension. Necropsy was performed at 24, 48 and 72 hours and cultures were made from heart, lung, liver and spleen samples. Bacterial loads of lung and liver were calculated as CFU/g. Combination therapies with doripenem were more effective than monotherapy at 24 and 48 hours of infection but no differences between groups were detected at 72 hours. The combination of doripenem with tigecycline and amikacin began to eradicate the bacterial load of lung and liver after 48 hours of infection, whereas doripenem+sulbactam and doripenem+colistin were started to eradication at 72 hours. The results of the study showed that combination therapies with doripenem are more effective than monotherapy and the combination of doripenem with tigecycline or amikacin has more rapid bactericidal effect than that with sulbactam or colistin.

Colistin-based combination therapy resulted in significantly higher microbiological eradication rates, relatively higher cure and 14-day survival rates, and lower in-hospital mortality compared to colistin monotherapy. CC, CS, and CO combinations for XDR-ABSI did not reveal significant differences with respect to 14-day survival and clinical or microbiological outcome before and after propensity score matching (PSM). PBS, age, and length of ICU stay were independent risk factors for 14-day mortality.

Combination antibiotic treatment versus monotherapy for multidrug-resistant, extensively drug-resistant, and pandrug-resistant *Acinetobacter* infections: a systematic review

Combination antibiotic treatment versus monotherapy for multidrug-resistant, extensively drug-resistant, and pandrug-resistant *Acinetobacter* infections: a systematic review

P. Poulikakos · G. S. Tansarli · M. E. Falagas

Abstract Controversy surrounds combination treatment or monotherapy against multidrug-resistant (MDR), extensively drug-resistant (XDR), and pandrug-resistant (PDR) *Acinetobacter* infections in clinical practice. We searched the PubMed and Scopus databases for studies reporting on the clinical outcomes of patients infected with MDR, XDR, and PDR *Acinetobacter* spp. with regard to the administered intravenous antibiotic treatment. Twelve studies reporting on 1,040 patients suffering from 1,044 infectious episodes of MDR *Acinetobacter* spp. were included. The overall mortality between studies varied from 28.6 to 70 %; from 25 to 100 % in the monotherapy arm and from 27 to 57.1 % in the combination arm. Combination treatment was superior to monotherapy in three studies, where carbapenem with ampicillin/sulbactam (mortality 30.8 %, $p=0.012$), carbapenem with colistin (mortality 23 %, $p=0.009$), and combinations of colistin with rifampicin, sulbactam with aminoglycosides, tigecycline with colistin and rifampicin, and tigecycline with rifampicin and amikacin (mortality 27 %, $p<0.05$) were used against MDR *Acinetobacter* spp. resistant at least to carbapenems. The benefit was not validated in the remaining studies. Clinical success varied from 42.4 to 76.9 % and microbiological eradication varied from 32.7 to 67.3 %. Adverse events referred mainly to polymixins nephrotoxicity that varied from 19 to 50 %. The emergence of resistance was noted with tigecycline regimens in off-label uses in three studies. The available data preclude a firm recommendation with regard to combination treatment or monotherapy. For the time being, combination treatment may be preferred for severely ill patients. We urge for randomized controlled trials examining the optimal treatment of infections due to MDR, XDR, and PDR *Acinetobacter* spp.

Eur J Clin Microbiol Infect Dis 2014;33:1675-85

Kolistin

- Ağır hastalığı olanlarda kombinasyon tedavisi tercih edilmeli

- Direnç önlenmesi için kombinasyon kullanılmalı

  - **Kolistin+rifampisin**
  - **Kolistin+sulbaktam**
  - **Kolistin+aminoglikozid**
  - **Kolistin+tigesiklin**
  - **Karbapenem+rifampisin**
  - **Karbapenem+aminoglikozid**
  - **Karbapenem+sulbaktam**

Yoğun bakımda ne zaman Stenotrophomonas maltophilia enfeksiyon etkeni olarak düşünülmeli?

Zahide Karaca[1], Zuhal Özer Şimşek[2], İsmail Hakkı Akbudak[1], Fatma Cevahir[3], Ramazan Coşkun[1], Emine Alp Meşe[2]
[1]Erciyes Üniversitesi Tıp Fakültesi İç Hastalıkları Anabilim Dalı Yoğun Bakım Ünitesi
[2]Erciyes Üniversitesi Tıp Fakültesi Enfeksiyon Hastalıkları ve Klinik Mikrobiyoloji Anabilim Dalı
[3]Erciyes Üniversitesi Tıp Fakültesi Enfeksiyon Kontrol Kurulu

GİRİŞ VE AMAÇ: Stenotrophomonas maltophilia (SM) hastanede yatan hastalarda çok ilaca dirençli fırsatçı bir gram negatif basildir. Yoğun bakım ünitelerinde (YBÜ) çok ilaca dirençli patojenler ile ilişkili enfeksiyon sıklığında artış ve artmış geniş spektrumlu antibiyotik kullanımı fırsatçı enfeksiyonlara zemin hazırlamaktadır. Bu çalışmanın amacı YBÜ'lerinde SM enfeksiyonu için risk faktörlerinin ve mortalite ilişkili faktörlerin belirlenmesidir.

YÖNTEM: Çalışmada Ocak 2010 ve Aralık 2014 tarihleri arasında Erciyes Üniversitesi Tıp Fakültesi (ERÜTF) YBÜ'lerinde nozokomiyal enfeksiyon nedeniyle takip edilen hastalar retrospektif olarak değerlendirildi. Vaka grubu olarak SM enfeksiyonu olan hastalar, kontrol grubu olarak SM dışı nozokomiyal enfeksiyonu olan hastalar seçildi. Hasta bilgileri Enfeksiyon Kontrol Kurulu kayıtlarından elde edildi.

BULGULAR: Çalışmaya toplam 137 hasta alındı. Bu hastaların 52'sinde SM enfeksiyonu, 85'inde diğer nozokomiyal patojenlere bağlı enfeksiyon mevcuttu. Hastaların genel yaş medyanı 64.0 (17-87) idi. Gruplar arasında yaş, cinsiyet ve yoğun bakıma yatışında APACHE II açısından anlamlı fark yoktu. Gruplar karşılaştırıldığında çok değişkenli analizde polimikrobiyal enfeksiyon varlığı, steroid dışı immünsupresif ilaç kullanımı, SM izlemesi öncesi gelişmiştir antibiyotik kullanımı, eşlik eden solunum sistemi hastalığı varlığı ve arteryal kateter kullanımı SM için bağımsız risk faktörü olarak belirlendi.

TARTIŞMA VE SONUÇ: Septik şokta uygun antibiyotik tedavisinin erken başlanmasının mortaliteye etkisi bilinmektedir. Kritik hastada tespit edilen risk faktörlerinin varlığında hastalar SM enfeksiyonu için ampirik antibiyotik tedavisi açısından değerlendirilebilir.

Anahtar Kelimeler: Stenotrophomonas maltophilia,

In vitro synergistic activity of tigecycline in combination with colistin, levofloxacin, amikacin and imipenem against five non-susceptible strains

Ann Clin Microbiol Antimicrob 2009;8:18

Effectiveness of tigecycline-based versus colistin- based therapy for treatment of pneumonia caused by multidrug-resistant *Acinetobacter baumannii* in a critical setting: a matched cohort analysis

Yu-Chung Chuang[1,2], Chien-Yu Cheng[3], Wang-Huei Sheng[1*], Hsin-Yun Sun[1], Jann-Tay Wang[1], Yee-Chun Chen[1,4] and Shan-Chwen Chang[1,4]

BMC Infect Dis 2014;14:102

Abstract

Background: Colistin and tigecycline have both been shown good *in vitro* activity among multi-drug resistant *Acinetobacter baumannii* (MDRAB). A comparative study of colistin versus tigecycline for MDRAB pneumonia is lacking.

Methods: The study enrolled adults with MDRAB pneumonia admitted to intensive care units at a referral medical center during 2009–2010. Since there were no standardized minimum inhibitory concentration (MIC) interpretation criteria of tigecycline against *A. baumannii*, MIC of tigecycline was not routinely tested at our hospital. During the study periods, MIC of colistin was not routinely tested also. We consider both colistin and tigecycline as definite treatments of MDRAB pneumonia. Patients who received tigecycline were selected as potential controls for those who had received colistin. We performed a propensity score analysis, by considering the criteria of age, gender, underlying diseases, and disease severity, in order to match and equalize potential prognostic factors and severity in the two groups.

Results: A total of 294 adults with MDRAB pneumonia were enrolled, including 119 who received colistin and 175 who received tigecycline. We matched 84 adults who received colistin with an equal number of controls who received tigecycline. The two well matched cohorts share similar characteristics: the propensity scores are colistin: 0.37 vs. tigecycline: 0.37, ($P = .97$); baseline creatinine (1.70 vs. 1.81, $P = .50$), and the APACHE II score (21.6 vs. 22.0, $P = .99$). The tigecycline group has an excess mortality of 16.7% (60.7% vs. 44%, 95% confidence interval 0.9% – 32.4%, $P = .04$). The excess mortality of tigecycline is significant only among those with MIC >2 μg/mL (10/12 vs. 37/84, $P = .01$), but not for those with MIC ≤ 2 μg/mL (4/10 vs. 37/84, $P = .81$).

Conclusions: Our data disfavors the use of tigecycline-based treatment in treating MDRAB pneumonia when tigecycline and colistin susceptibilities are unknown, since choosing tigecycline-based treatment might result in higher mortality. The excess mortality of tigecycline-based group may be related to higher MIC of tigecycline (> 2 μg/mL). Choosing tigecycline empirically for treating MDRAB pneumonia in the critical setting should be cautious.

- The use of TGC at higher than standard doses is safe in critically ill patients
- The high TGC dosing regimen improves the outcome of patients with MDR Gram-negative VAP

Crit Care 2014;18:R90

Effectiveness and safety of high-dose tigecycline-containing regimens for the treatment of severe bacterial infections

Matthew E. Falagas[a,b,c,*], Konstantinos Z. Vardakas[a,b], Konstantinos P. Tsiveriotis[a], Nikolaos A. Triarides[a,b], Giannoula S. Tansarli[a]

Here we review the effectiveness and safety of high-dose tigecycline (200 mg daily). A systematic search was performed in PubMed and Scopus databases as well as of abstracts presented at scientific conferences. Eight studies (263 patients; 58% critically ill) were included, comprising one randomised controlled trial (RCT), four non-randomised cohorts and three case reports. *Klebsiella pneumoniae* was the most commonly isolated pathogen (reported in seven studies). In the RCT, response in the clinically evaluable patients was 85.0% (17/20) in the 100 mg every 12 h (q12 h) group and 69.6% (16/23) in the 75 mg q12 h group ($P = 0.4$). More episodes of diarrhoea, treatment-related nausea and vomiting developed in the high-dose group (14.3% vs. 2.8%, 8.6% vs. 2.8% and 5.7% vs. 2.8%, respectively; $P > 0.05$ for all comparisons). Three (8.6%) and 7 (19.6%) patients died in the 200 mg and 150 mg daily dose groups, respectively. The cohort studies enrolled patients with severe infections, including ventilator-associated pneumonia and complicated intra-abdominal infections. Mortality with high-dose tigecycline (100 mg q12 h) in the cohort studies ranged from 8.3% to 26%; mortality in the low-dose groups (50 mg q12 h) ranged from 8% to 61% and depended on the severity of the underlying infection. There are limited available data regarding the effectiveness and safety of high-dose tigecycline. Most of the data come from critically ill patients with difficult-to-treat infections. Pharmacokinetic/pharmacodynamic properties of tigecycline suggest that high-dose regimens may be more effective than low-dose regimens. Candidates for administration of high-dose tigecycline should be also defined.

ABSTRACT

This study was performed to investigate the mechanisms of in vivo acquisition of colistin resistance in *A. baumannii* during colistin treatment. Three colistin-susceptible/resistant pairs of *A. baumannii* were recovered from patients who underwent colistin treatment. All of the 6 isolates included in this study shared an identical sequence type (ST), ST375, and they showed identical *SmaI*-macrorestriction patterns by pulsed-field gel electrophoresis. The individual colistin-resistant isolates harbored distinct mutations in the *pmrB* gene. Mutations detected in the *pmrB* gene were Ala227Val, Pro233Ser, and frame shift from Phe26. In matrix-assisted laser desorption ionization–time of flight analysis, colistin-resistant isolates were different from their colistin-susceptible counterparts, and they showed additional distinct peaks at 1852 m/z, 1937 m/z, 1954 m/z, 1975 m/z, 2034 m/z, and 2157 m/z. In vivo selection of colistin-resistant *A. baumannii* occurred independently in strains of ST357 during colistin treatment, and the strains acquired colistin resistance via mutations in the *pmrB* gene resulting in modification of lipid A components.

Colistin-Resistant *Acinetobacter baumannii*: Beyond Carbapenem Resistance

Clin Infect Dis 2015;60:1295-1303

Zubair A. Qureshi,[1] Lauren E. Hittle,[2] Jessica A. O'Hara,[1] Jesabel I. Rivera,[1] Alveena Syed,[1] Ryan K. Shields,[1] Anthony W. Pasculle,[3] Robert K. Ernst,[2] and Yohei Doi[1]

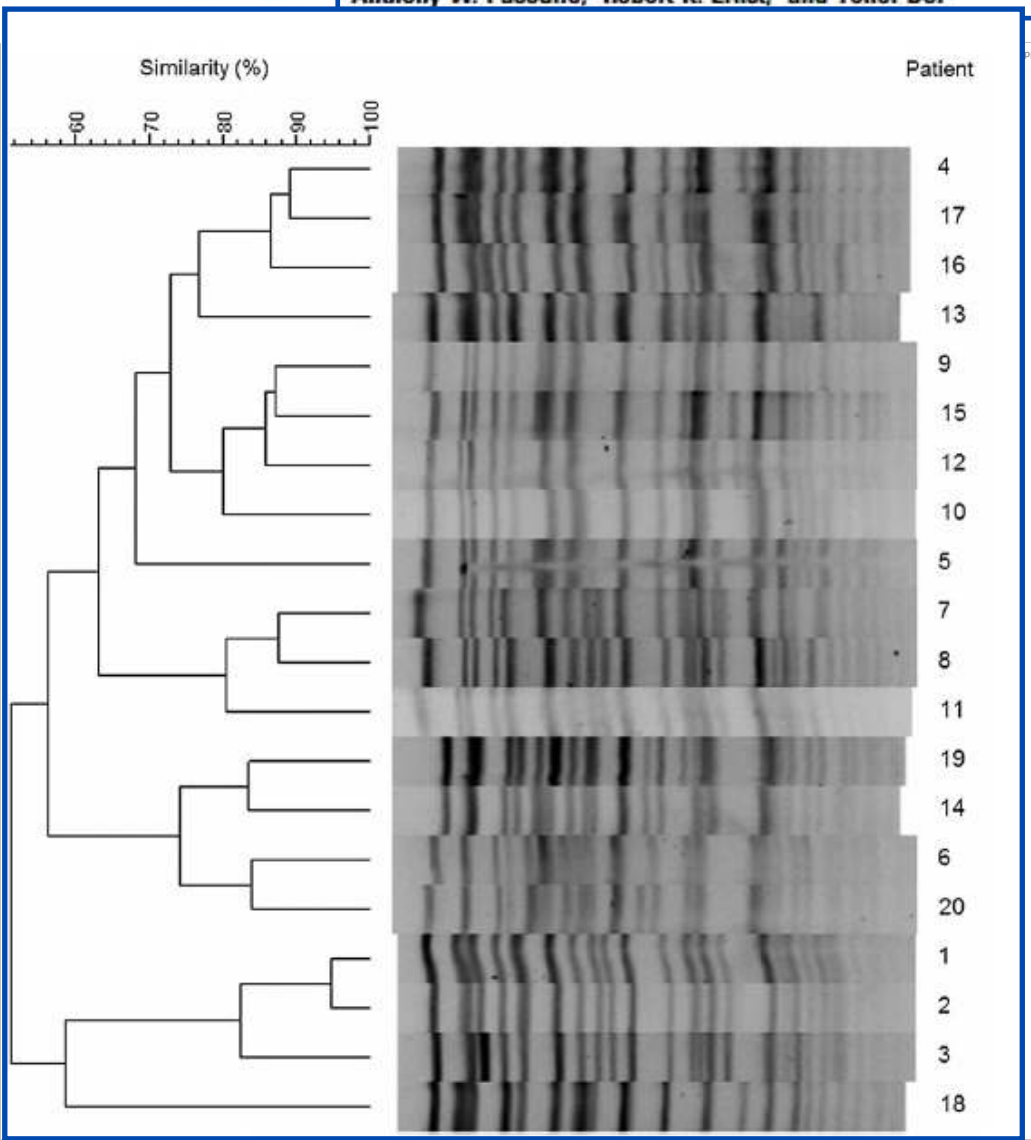
Table 1. Characteristics and Outcomes of Patients With Colistin-Resistant *Acinetobacter baumannii*

Patient	Age	Sex	Underlying Diseases	Culture Site	Type of Infection	ICU	APACHE II Score	Prior Intravenous CMS, d[a]	Prior Inhaled CMS, d[a]	Treatment of Colistin-Resistant Infection	Clinical Response	30-d Mortality	Death Attributable to Infection	90 d Recurrence
1	55	F	Lung transplant	Sputum	VAP	Yes	21	16	16	CMS, TIG, AMS	Failure	Yes	Yes	. . .
2	63	M	Heart transplant	Mediastinal fluid	Mediastinitis	Yes	25	8	None	CMS, TIG	Failure	Yes	Yes	. . .
3	43	M	Lung transplant	BAL	VAP	Yes	19	76	84	AMS, TIG, RIF	Failure	Yes	No[b]	. . .
4	53	M	Renal transplant	Sputum	VAP	Yes	20	5	None	CMS, DOR, AMS	Success	No	. . .	No
5	84	F	Dementia, recurrent pneumonia	Tracheal aspirate	VAP	Yes	20	14	14	CMS, DOR	Success	No	. . .	Yes
6	76	F	CVA	BAL	VAP	Yes	28	15	9	AMS	Failure	Yes	No[b]	. . .
7	36	M	Morbid obesity, liver cirrhosis	BAL	VAP	Yes	25	10	11	CMS, DOR	Failure	No	. . .	. . .
8	68	M	Lung transplant	Sputum	Colonization	Yes	22	4	7	None	. . .	No	. . .	No
9	61	M	Heart and lung transplant	Sputum	HAP	No	15	5	9	CMS, DOR, AMS	Success	No	. . .	Yes
10	52	F	Liver transplant	BAL	VAP	Yes	20	11	10	CMS, DOR, AMS	Success	No	. . .	No
11	62	M	Lung transplant	Bronchial wash	VAP	Yes	12	14	14	CMS, DOR, AMS	Success	No	. . .	No
12	71	M	Lung transplant	Bronchial wash	VAP	Yes	17	None	9	CMS (inhaled only), DOR	Success	No	. . .	No
13	62	F	Mental retardation, Parkinson's disease	BAL	VAP	Yes	13	28	28	CMS, DOR	Failure	Yes	Yes	. . .
14	66	F	CVA	BAL	VAP	Yes	20	32	15	CMS, DOR	Failure	Yes	Yes	. . .
15	63	M	CVA	BAL	Colonization	Yes	15	2	None	None	. . .	No	. . .	No
16	77	M	Lung transplant	Sputum	Colonization	Yes	17	7	7	None	. . .	No	. . .	No
17	63	F	Lung transplant	BAL	VAP	Yes	10	30	6	CMS, DOR, AMS	Success	No	. . .	No
18	25	F	Toxic epidermal necrolysis	Pleural fluid	VAP	Yes	19	21	21	CMS, MEM	Success	No	. . .	No
19	73	M	Lung transplant	Blood	Bacteremia	Yes	19	None[c]	None[c]	CMS, DOR, AMS	Success	No	. . .	No
20	57	M	COPD, tonsillar carcinoma	Blood	Bacteremia	Yes	27	7	5	CMS, DOR, AMS	Success	No	. . .	No

Colistin-Resistant *Acinetobacter baumannii*: Beyond Carbapenem Resistance

Clin Infect Dis 2015;60:1295-1303

Zubair A. Qureshi,[1] Lauren E. Hittle,[2] Jessica A. O'Hara,[1] Jesabel I. Rivera,[1] Alveena Syed,[1] Ryan K. Shields,[1] Anthony W. Pasculle,[3] Robert K. Ernst,[2] and Yohei Doi[1]



- 38 (18 kol-H, 18 kol-D, 2 kol-D) izolatın PFGE ile genotipik yakınlığı araştırılmış
- 9 klon tespit edilmiş
- Farklı hastalardan farklı klon tespit edilmiş
- Aynı hastadan izole edilen Kol-H ve Kol-D olgular aynı klona ait
- Kolistin direnci tedavi sırasında gelişiyor
- Dirençten Lipid A modifikasyonu sorumlu

Kolistine Dirençli Gram Negatif Bakteri

- Uzun süreli ve gereksiz kullanım
- Uygun sürede kullanılmalı, de-eskalasyon yapılmalı
- Enfeksiyon kontrolü önemli

In vitro synergism of combinations of colistin with selected antibiotics against colistin-resistant Acinetobacter baumannii

Percin D, et al. GMS Hygiene and Infection Control 2014;9:1-5

Kolistine Dirençli *K.pneumoniae* Tedavi Seçenekleri

- Tigesiklin
- Aminoglikozid
- Fosfomisin
- İkili karbapenem (ertapenem+meropenem)+kolistin
